13. ABSTRACT <p>(U) In an earlier pilot study of the narrative sections of Navy performance evaluations for senior enlisted personnel in pay grade E-7, it was determined by content analytic techniques that it is possible to differentiate between the performance of typical and superlative chief petty officers based on the narrative content of Evaluation Reports. A second study attempted to cross validate the pilot study results on new Evaluation Reports for senior enlisted men in the same two occupational ratings (AT's and BT's) represented in the pilot study sample and to extend the content analysis to two different occupational ratings (CS's and RM's) in order to test the generalizability of the content analytic techniques developed earlier. As a further refinement, the cross validation and generalization samples were analyzed without any knowledge of the ratee's relative position in the upper half of the marking scale on Performance of Duty (the criterion variable). A reliability study was also conducted whose objectives were twofold: (1) to determine the level of agreement among four individuals all of whom independently would perform a content analysis of the same corpus of 48 Evaluation Reports, and (2) to investigate if nonresearchers could be trained successfully to apply the complex content analysis methodology developed in the pilot study. This report presents detailed evidence that the pilot study findings essentially were extendible to the blind cross validation sample consisting of the same two ratings and also were generalizable to two different occupational ratings. Despite the initial expectation that it would be extremely difficult to train nonresearch-oriented individuals to consistently index the narrative sections of Evaluation Reports, the surprising result in the reliability study was that in only six training sessions a quite respectable level of agreement was achieved.</p>

## ACKNOWLEDGMENTS

This research project has concerned itself with developing a valid content analysis methodology for analyzing the narrative sections of Navy performance evaluations for senior enlisted personnel in pay grade E-7 in order to determine if it is possible to differentiate between the performance of outstanding chief petty officers and their slightly less qualified colleagues. This technical report presents the findings resulting from an attempt to cross validate and generalize the results of an earlier pilot study and to elucidate the issues of trainability and reliability. The continuing investigations being conducted under the auspices of this project are sponsored by the Personnel and Training Research Programs, Psychological Sciences Division, Office of Naval Research. The Navy Personnel Research and Development Center (NPRDC), San Diego, California, provided the data bases used in this research, supplied the keypunching required in the initial pilot study, and performed the computer calculations of the Mann-Whitney U tests for both the pilot study and the cross validation and generalization study. The correlation matrices reported in Appendix C were also computed by NPRDC at the computing facility of the Naval Electronics Laboratory Center in San Diego. The continuing support by ONR and the cooperation from NPRDC are gratefully acknowledged. Marshall J. Farr, Ph.D., Director of Personnel and Training Research Programs, Office of Naval Research, and Joseph L. Young, Ph.D., Assistant Director of Personnel and Training Research Programs, Office of Naval Research, have provided intellectual input and encouragement. Bernard Rimland, Ph.D., former Director of the Personnel Measurement Research Department, Naval Personnel and Training Research Laboratory, and David W. Robertson and Marjorie H. Royle of his department gave willingly and extensively of their time in obtaining the data bases and conferring about issues of experimental design and statistical methodology. Their guidance provided insight into potential applications for this research endeavor. To all of these individuals I wish to express my special appreciation.

During the writing stage, this report was reviewed by Mr. David H. Robertson and Mrs. Marjorie H. Royle. Their valuable suggestions have been incorporated into the final product.

Keypunching of the cross validation and generalization samples was performed at the UCLA Health Sciences Computing Facility, as were the descriptive statistics, *t* tests of mean difference, and the stepwise discriminant analyses. This facility operates under the directorship of Wilfrid J. Dixon, Ph.D., and is sponsored by NIH Special Research Resources Grant RR-3. All of the agreement statistics calculated for the reliability study were performed on the Olivetti P602 microcomputer at R-K Research and System Design.

Mrs. Vivian Richman, M.L.S., played the major role in conceptualizing the 29 index terms used in the content analysis. She also was responsible for the exceptional quality and consistency of the indexing of the pilot study sample and the cross validation and generalization samples as well as for training

the reliability indexers. Mrs. Jonnie Handley assisted both the Principal Investigator and Mrs. Richman in the myriad tasks of coding for keypunching, quality control, data extraction, and statistical computation. Her quick comprehension and her diligent and careful work insured that the research schedule did not fall behind. Mrs. Handley also served as one of the reliability indexers.

Mrs. Carol J. Randall was responsible for the excellent typing of this technical report. She also served as one of the reliability indexers.

Diane M. Ramsey-Klee, Ph.D.  
Principal Investigator

## SUMMARY OF FINDINGS

In an earlier pilot study of the narrative sections of Navy performance evaluations for senior enlisted personnel in pay grade E-7, it was determined by content analytic techniques that it is possible to differentiate between the performance of typical and superlative chief petty officers based on the substantive content of Evaluation Reports. The results of this pilot study strongly suggested that there are stable differences among the performance characteristics of chief petty officers in the various portions of the upper half of the marking scale on Performance of Duty that are reflected in narrative statements written by evaluators.

The findings from the pilot study were considered to be provocative enough to warrant further investigation. Therefore, a second study was embarked upon to attempt to cross validate the pilot study results on new Evaluation Reports for senior enlisted men in the same two occupational ratings (AT's and BT's) that were represented in the pilot study sample and to extend the content analysis to Evaluation Reports for senior enlisted men in two different occupational ratings (CS's and RM's) than those investigated in the pilot study in order to test the generalizability of the content analytic techniques developed earlier. As a further refinement, the cross validation and generalization samples of Evaluation Reports were to be analyzed without any knowledge of the ratee's relative position in the upper half of the marking scale on Performance of Duty (the criterion variable). In the pilot study the criterion data were made available early in the study, thus introducing the possibility that this knowledge subconsciously might have influenced the content analysis that was performed. This factor was controlled for in the second study by withholding the criterion information until the content analysis of the narrative text had been completed.

Also of concern in the pilot study were the issues of reliability and trainability, although the scope of the small initial research effort did not permit these aspects to be studied in any substantial way. Therefore, in designing the second investigation these issues were dealt with by including a reliability study whose objectives were twofold: (1) to determine the level of agreement among four individuals all of whom independently would perform a content analysis of the same corpus of 48 Evaluation Reports, and (2) to investigate if nonresearchers could be trained successfully to apply the complex content analysis methodology developed in the pilot study.

In the earlier pilot investigation, the Navy Personnel Research and Development Center (NPRDC), San Diego, selected a sample of 225 Evaluation Reports for senior enlisted personnel in pay grade E-7 including 145 Aviation Electronics Technicians (AT's) and 80 Boilermakers (BT's). All 225 Evaluation Reports were drawn from the top half of the marking scale on 19A-PERFORMANCE OF DUTY of Evaluation Report Form NAVPERS 1616/8. This form subsequently has been replaced by another form that can be scanned by an optical character reader; however, the content of the two forms is essentially the same. The pilot study sample of 225 Evaluation Reports was divided equally into three criterion groups---Upper, Middle, and Lower---corresponding to three continuous segments of the upper half of the marking scale on 19A-PERFORMANCE OF DUTY.

In the study being reported here, NPRDC also selected the sample of Evaluation Reports to be analyzed. The cross validation sample consisted of 222 Evaluation Reports from the same two ratings that were used in the pilot study (i.e., AT's and BT's). In addition, a generalization sample consisting of 222 Evaluation Reports was also selected by NPRDC from two different ratings in order to ascertain the generalizability of the content analytic methodology developed in the pilot study. The two ratings from which the generalization sample was drawn were Commissarymen (CS's) and Radiomen (RM's). The N's in the various occupational ratings represented in the cross validation and generalization samples were 138 AT's, 84 BT's, 60 CS's, and 162 RM's. The cross validation sample and the generalization sample were each divided equally into the same three criterion groups as the pilot study sample---Upper, Middle, and Lower. Actual criterion group membership for the cross validation sample and the generalization sample was known only to NPRDC until the content analysis of the narrative text had been completed. Consequently, the content analysis of these two samples was conducted in the blind without benefit of knowing to which criterion group each Evaluation Report belonged.

An indexing vocabulary consisting of 29 descriptive labels was devised to encompass the substantive content of the narrative sections of Evaluation Reports. These 29 index terms fell into three major areas---MANAGEMENT FUNCTIONS, SKILLS AND ABILITIES, and PRODUCTIVITY AND ACHIEVEMENT. Under each of these headings there were more detailed terms such as PLANNING, TECHNICAL SKILLS, and AWARDS AND PUNISHMENT, providing the indexer with a 3-level hierarchy of descriptive labels from which to choose. Each sentence of narrative text in the pilot study sample and the cross validation and generalization samples was read carefully and, where appropriate, divided into segments corresponding to the assignment of specific index terms. However, it is not enough to simply label a narrative statement with the most appropriate index term since the statement may have been a highly positive, quite positive, neutral, quite negative, or highly negative one. Therefore, a weighting scale containing five degrees of favorableness/unfavorableness was devised based on the range of adjectives and adverbs that occur in narrative text of this kind. The indexing procedure that was used in this study was the following: The narrative text of each Evaluation Report was read, segmented into distinct statements, and each statement was assigned one or more index terms from the set of 29 possible choices. Each term selected was also assigned a numerical weight from 1 to 5 depending upon the nature of the adjectives or adverbs used as modifiers in the statement. When the entire narrative text of the Evaluation Report had been indexed, the indexing decisions that had been made were recorded on a special indexing form.

A set of 67 quantitative variables was derived from the indexing form used in the content analysis. The first 29 variables reflect the simple frequency with which each index term was used to index a particular section of narrative text. Variable 30 is the sum of these 29 frequencies. Variables 30 through 59 represent the weighted frequency of each index term used to index a particular section of narrative text. Variable 60 is similar to Variable 30 in that it is the sum of the 29 weighted frequencies. Variables 61 through 65 represent the frequency counts over the entire indexing form for all 5 weights, 4 weights, 3 weights, 2 weights, and 1 weights. Variable 66 is the total number of words in the section of narrative text that was indexed.

Variable 67 is the total number of index terms of the 29 available that were used to index the section of narrative text. Profiles or vectors of these 67 values then were prepared for all of the Evaluation Reports contained in each sample. Separate profiles were compiled for the evaluation section (19R) and the justification section (19S) of each Evaluation Report.

Descriptive statistics were computed for each of the three research samples on the 67 quantitative variables. As expected these statistics showed in general that the higher the criterion group, the longer the narrative text. Also, as the evaluator uses more words to describe the ratee, he is more likely to comment on a wider variety of specific areas of the ratee's performance. Correlations among all 67 variables for the evaluation section and for the justification section also were computed for the cross validation and generalization samples as well as the matrix correlating the evaluation section with the justification section on all 67 variables. There were very few high correlations except for the correlations between Variables 1 through 30 and Variables 31 through 60, these two sets of variables being the same except for the method of weighting that was used. Variable 67 (Total Number of Index Terms Used) is a focal variable, correlating highly with Variable 30 (Sum of Variables 1 through 29), Variable 60 (Sum of Variables 31 through 59), Variable 61 (Total Number of 5 Weights), Variable 62 (Total Number of 4 Weights), Variable 63 (Total Number of 3 Weights), and Variable 66 (Total Number of Words in the Narrative Text). Correlations among the variables having to do with the 29 index terms per se were notably low, indicating that these 29 dimensions are relatively orthogonal and represent independent aspects of managerial performance. In the correlation matrix for the evaluation section versus the justification section, no high correlations were evident in either the cross validation sample or the generalization sample, demonstrating that these two narrative sections of Evaluation Report Form NAVPERS 1616/8 are quite independent and should be treated separately.

Both the Mann-Whitney U test and the t test of mean difference were computed on each of the 67 variables for the pilot study sample, the cross validation sample, and the generalization sample. These computations were made for each pair of criterion groups in both the evaluation and the justification sections. The most difficult discrimination to be made is that between the Middle and Upper criterion groups. In the cross validation sample the characteristics that differentiated outstanding CPO's from their slightly less qualified colleagues on the evaluation section were cooperation, grooming and attire, resourcefulness, and productivity and achievement. Cooperation was also implicated as a discriminating variable between the Middle and Upper criterion groups on the evaluation section in the pilot study sample. On the justification section, eight variables showed a statistically significant difference between the Middle and Upper criterion groups in both the pilot study sample and the cross validation sample. When an evaluator is required to justify his marks in evaluating a ratee, he apparently calls out certain areas of performance that distinguish the ratee in the Upper criterion group from his slightly less qualified colleague in the Middle criterion group. Skills and abilities as well as productivity and achievement were the differentiating areas of performance. The ratee in the Upper criterion group also had bestowed upon him more superlative adjectives and adverbs. Total Number of Words in Text and Total Number of Index Terms Used were also discriminating variables.

In the comparison between the Middle and Upper criterion groups on the evaluation section of the generalization sample, Total Number of 5 Weights (Excellent), Total Number of 2 Weights (Poor), and potential were the discriminating variables. None of these variables overlapped with those that were statistically significant for the Middle versus Upper criterion group comparison on the evaluation section of the cross validation sample. Seventeen of the 67 quantitative variables showed a statistically significant difference between the Upper and Middle criterion groups on the justification section for both the cross validation sample and the generalization sample, the most significant of which were Total Number of 5 Weights (Excellent), Total Number of 4 Weights (Good), Total Number of 2 Weights (Poor), Total Number of Index Terms Used, Sum of Variables 1 through 29, Sum of Variables 31 through 59, leadership and directing, communication, cooperation, technical skills, drive, and potential. This finding suggests that there is partial overlap between these two samples. The nonoverlapping areas may be attributed to a difference in the nature of the occupational ratings represented in the cross validation and the generalization samples and/or to unreliability in the indexing procedure, although the results of the reliability study suggest that differences among the four occupational ratings provide a more reasonable explanation for these results than unreliability.

In every pairwise criterion group comparison made for the three research samples using the Mann-Whitney U test and the *t* test of mean difference, one or more of the five variables involving total number of weights proved to be significantly differentiating. This finding supports the results of the correlational analysis in which the system used for weighting Variables 31 through 59 was highlighted as an important aspect of the content analysis methodology.

It is of considerable interest to learn how well the set of 67 quantitative variables, used in optimal combination, can classify each of the research samples into correct criterion group. A stepwise discriminant analysis program was used to perform this analysis. A special feature of this program allows new cases to be classified by the discriminant functions generated on the original sample. This feature was used to conduct two cross validation studies of the AT's and BT's combined and also of the AT's and BT's considered separately. The results of the two cross validation studies were very similar for the total cross validation sample and the total pilot study sample, for the cross validation AT's and the pilot study AT's, and for the cross validation BT's and the pilot study BT's. These findings support the expectation held at the outset of this investigation that it would be possible to index the cross validation sample in the blind, without knowledge of criterion group membership, and achieve as good classification accuracy as was achieved with the pilot study sample where criterion group membership was known to the indexer. Further, it can be concluded that better classification into the three criterion groups using an optimum combination of the 67 quantitative variables is achieved when the two occupational ratings represented in the pilot study sample and the cross validation sample are treated separately. These findings suggest that classification procedures based on the content analysis methodology developed in this research should be tailored to specific occupations. In all of the stepwise discriminant analyses performed, better classification was achieved in the analysis of the justification section compared to the evaluation section. Classification of each sample by its own

discriminant functions achieved perfect classification for the BT's on the justification section in both the pilot study sample and the cross validation sample. In the pilot study sample, 95 percent of the AT's were classified correctly on the justification section. In the cross validation sample, 93 percent of the AT's were classified correctly on the justification section. The superior classification accuracy achieved for the BT's compared to the AT's indicates that the Aviation Electronics Technician rating may represent a more varied amalgamation of technical activities than the Boilerman rating. Further, it appears that the best classification accuracy than can be achieved on a second sample using the discriminant functions generated on the first sample, with the content analysis methodology developed thus far, is 65 to 70 percent.

In the stepwise discriminant analyses of the generalization sample, all 60 generalization CS's were correctly classified on the justification section. Of the 162 generalization RM's, 89 percent were correctly classified on the justification section. This suggests that the occupational rating, Radioman, may be more heterogeneous and require a greater variety of skills than the Commissaryman rating just as the Aviation Electronics Technician rating may represent a more varied amalgamation of technical activities than the Boilerman rating. It is evident from these results that the content analysis methodology developed initially on the pilot study sample consisting of AT's and BT's was generalizable to a new sample consisting of two different occupational ratings, viz., CS's and RM's.

In the double cross validation of the pilot study sample and the cross validation sample, the best classification accuracy for the sample being cross validated was achieved early in the stepwise discriminant analysis procedure, typically by the fifth step. The key discriminating variables for the evaluation section were Total Number of 5 Weights (Excellent) and Total Number of 2 Weights (Poor). In the justification section without exception the key discriminating variable was Total Number of Index Terms Used. These same three variables were those selected first in the stepwise discriminant analysis of the generalization sample. It appears that the modifying adjectives used by an evaluator to rate a ratee and the range of skills and abilities that a chief petty officer possesses may be key factors in the ratee's superior performance. The results also suggest that a smaller number of dimensions than the full complement of 67 quantitative variables derived from the indexing procedure can be used to identify superlative CPO's whose superior performance recommends them as candidates for promotion to a higher level of responsibility.

In addition to the cross validation and generalization study, a comprehensive reliability study was conducted whose objectives were twofold: (1) to determine the level of agreement among several individuals all of whom independently would perform a content analysis of the same corpus of Evaluation Reports, and (2) to investigate if nonresearchers could be trained successfully to apply the complex content analysis methodology developed in the pilot study.

A set of 48 Evaluation Reports was selected by the Navy Personnel Research and Development Center, representing a cross section of the kinds of reports

included in the overall experimental design for the cross validation and generalization samples. In each of these 48 Evaluation Reports the evaluation section was separated from the justification section so that the narrative comments for each section were not considered together. This resulted in a group of 96 randomized pieces of narrative text to be indexed in the reliability study.

Four individuals participated in the reliability study: (1) the experienced indexer who also indexed the pilot study sample, the cross validation sample, and the generalization sample; (2) the principal investigator; (3) an inexperienced indexer (inexperienced indexer A) with two years of college in the liberal arts; and (4) another inexperienced indexer (inexperienced indexer B) with executive secretary experience. To this end a training manual was prepared by the experienced indexer and the principal investigator to assist the two neophyte indexers in understanding their assignment. Six intensive training sessions were conducted by the experienced indexer in order to try to bring all four indexers up to a common level of expertise before beginning the actual study. Obviously, this objective could only be met partially in view of the varying educational backgrounds of the four reliability indexers and their different levels of previous exposure to the indexing dictionary.

In all of the agreement statistics that were computed, assignment of the index terms was considered to be a separate intellectual task from assigning the corresponding weights based on the modifying adjectives and adverbs. The kappa statistic was the measure of agreement used in analyzing the index terms assigned by the four reliability indexers. The best agreement in selecting index terms was obtained between the experienced indexer and inexperienced indexer A, a kappa of .88 where the maximum kappa possible in this instance was .97. Of the six possible pairwise comparisons between the four reliability indexers, the value of kappa ranged from .71 to .88, with .71 probably representing the lower limit of reliability achievable in a study of this kind. The kappa analysis revealed that the major area of confusion in indexing the reliability data base resided in whether or not to index supposedly factual statements describing the job duties and the qualifications needed for the position that the ratee occupied rather than the ratee's actual performance in this position. All three of the less experienced indexers tended to index these statements as describing the ratee's performance whereas the experienced indexer whom the other three indexers were trying to emulate treated these statements as factual descriptions of the job duties and the qualifications needed for the position. Additional training aimed at clarifying this area of confusion most likely would markedly reduce this type of disagreement and raise the magnitude of kappa.

Analysis of the level of agreement among the four reliability indexers in assigning numerical weights to each index term selected, based on the modifying adjectives and adverbs, was performed differently than the analysis of the level of agreement in selecting the index terms themselves, because the numerical weights assigned to the index terms constituted an ordinal scale whereas the index terms themselves formed a nominal scale. In the six pairwise comparisons between the four reliability indexers, six product moment correlation coefficients were computed as well as another agreement statistic, weighted kappa, in order to determine if weighted kappa agreed with the results of the correlational analysis. In the correlational analysis, once again the best

agreement in assigning numerical weights to each index term selected was obtained between the experienced indexer and inexperienced indexer A, a correlation coefficient of .80. These findings corroborate each other in suggesting that an individual without a research background in only six training sessions can be taught not only how to select the most appropriate index terms but also how to consistently assign weights to these terms based on the modifying adjectives and adverbs. The other five correlation coefficients were lower, but none less than .64.

As was expected, the weighted kappa values were similar in magnitude to their correlation coefficient counterparts. Again, the best agreement as measured by weighted kappa was obtained between the experienced indexer and inexperienced indexer A, a weighted kappa of .78. If the area of confusion involving overindexing on the part of inexperienced indexer A was ignored in the analysis, the value of weighted kappa increased to .82. The gain in the value of weighted kappa is not very large for the comparison between the experienced indexer and inexperienced indexer A when weighted kappa was recomputed in this fashion. However, the gain was quite substantial in the other comparisons between the experienced indexer and the principal investigator and between the experienced indexer and inexperienced indexer B. This suggests that with additional training to clarify this area of confusion and with more indexing experience, the level of agreement among the four reliability indexers could possibly be raised to a value of .80 to .85 as measured by any of the three agreement statistics employed in this study. However, values in the .90's are the ultimate objective.

In conclusion, it might be of interest to point out that the initial expectation in beginning this reliability study was that it would be extremely difficult to train nonresearch-oriented individuals to consistently index the narrative sections of Evaluation Report forms using the complex content analysis methodology that had been developed in the pilot study. The surprising result is that in only six training sessions a quite respectable level of agreement was achieved. Moreover, one of the inexperienced indexers showed a higher level of agreement with the experienced indexer than the principal investigator did, and the other inexperienced indexer agreed with the experienced indexer almost as well as the principal investigator. The intuitive feeling that the reliability indexers had after completing the reliability study was that the most difficult part of learning to index consistently was over and that with additional practice and some review training sessions they could improve their indexing skill.

## SECTION 1. INTRODUCTION

A goal of on-going research being conducted by the Navy Personnel Research and Development Center, San Diego, is to develop Navy enlisted performance evaluation formats which will be effective in holding down the pile-up of marks at the high end of the marking scale and in achieving a distribution of marks which tapers off sufficiently at the high end of the scale to permit greater differentiation among ratees, making evaluations more useful, especially when small selection opportunities are involved.<sup>1</sup> Thus far the narrative sections of Evaluation Reports have not been exploited to any great extent in the design of experimental forms because narrative text tends to resist easy analysis. However, in a pilot investigation of the narrative sections of Navy performance evaluations for senior enlisted personnel in pay grade E-7 conducted by R-K Research and System Design, it was determined by content analytic techniques that it is possible to differentiate between the performance of typical and superlative chief petty officers based on the substantive content of Evaluation Reports.<sup>2</sup> The results of this pilot study strongly suggested that there are stable differences among the performance characteristics of chief petty officers in the various portions of the upper half of the marking scale on Performance of Duty that are reflected in narrative statements written by evaluators. These differences are both identifiable and quantifiable. In the pilot study the significant differences resided in the superiority of the uppermost criterion group with respect to managerial skills and abilities, particularly as demonstrated in the areas of organization, initiative, cooperation, leadership and directing, professionalism, productivity and achievement, more awards and fewer punishments, more drive, more superlative attributes, and fewer qualified statements reflecting fair performance.

The findings from the pilot study were considered to be provocative enough to warrant further investigation. Therefore, a second study was embarked upon to attempt to cross validate the pilot study results on new Evaluation Reports for senior enlisted men in the same two occupational ratings that were represented in the pilot study sample and to extend the content analysis to Evaluation Reports for senior enlisted men in two different occupational ratings than those investigated in the pilot study in order to test the generalizability of the content analytic techniques developed earlier. As a further refinement, the cross validation and generalization samples of Evaluation Reports were to be analyzed without any knowledge of the ratee's relative position in the upper half of the marking scale on Performance of Duty (the criterion variable). In the pilot study the criterion data were made available early in the study, thus introducing the possibility that this knowledge subconsciously might have influenced the content analysis that was performed on the narrative sections of the Evaluation Reports. This factor was controlled for in the second study by withholding the criterion information until the content analysis of the narrative text had been completed.

Also of concern in the pilot study were the issues of reliability and trainability, although the scope of the small initial research effort did not permit these aspects to be studied in any substantial way. Therefore, in designing the second investigation these issues were dealt with by including a reliability study whose objectives were twofold: (1) to determine the level of agreement among four individuals all of whom independently would perform a

content analysis of the same corpus of Evaluation Reports, and (2) to investigate if nonresearchers could be trained successfully to apply the complex content analysis methodology developed in the pilot study.

The second study attempting to cross validate and generalize the pilot study results and to elucidate the issues of reliability and trainability was conducted during the contract year March 1, 1972 to February 28, 1973. This technical report presents the findings resulting from this follow-on investigation. Section 2 of this report describes the nature of the cross validation and generalization samples. Section 3 presents the content analysis methodology that was used in both the pilot study and the second study. Section 4 discusses the statistical methodology that was used to analyze the data and the results that were obtained. Section 5 describes the design of the reliability study and presents the results achieved. In Section 6 future areas of investigation are delineated.

## SECTION 2. NATURE OF THE PILOT STUDY SAMPLE AND THE CROSS VALIDATION AND GENERALIZATION SAMPLES

As a result of research conducted at the Navy Personnel Research and Development Center, San Diego, to develop experimental forms for evaluating personnel in pay grades E-7 (Chief Petty Officer), E-8 (Senior Chief Petty Officer), and E-9 (Master Chief Petty Officer), a new evaluation report form---NAVPER 1616/8---was introduced into operational use in January 1969 (see Figure 1).<sup>\*</sup> This form had been demonstrated as effecting a substantial improvement in the distribution of operational evaluation marks over the previously used form, NAVPER 792, as reflected in a reduced pile-up of marks at the high end of the marking scale and greater differentiation among ratees.<sup>1</sup>

Section 19, Evaluation Section, of Evaluation Report Form NAVPER 1616/8 is designed to permit the rater (evaluator) to compare the ratee with all others of his rate known to the rater on 13 specific aspects of on-job performance. Ratings are made by marking the column of the rating distribution into which the rater evaluates that the ratee falls for each of the 13 specific aspects of on-job performance plus an overall evaluation of the ratee (for example, top 1% for superlative performance). Section 19R of this form provides space for the rater to write narrative evaluation comments to describe further the ratee's performance and qualifications. Section 19S of this form provides space for the rater to write narrative justification comments and is required to support any marks assigned to the top or bottom 10, 5, or 1% columns of Section 19.

Sections 19R and 19S are referred to as the narrative text of the Evaluation Report since they are the only portions of the report where the rater uses his own words to assess the on-job performance of the senior enlisted man that he is rating. Thus far the narrative evaluation and justification sections of the Evaluation Report have not been exploited systematically in making personnel decisions because narrative text tends to resist objective analysis and interpretation.

In the earlier pilot investigation, the Navy Personnel Research and Development Center (NPRDC), San Diego, selected a sample of 225 Evaluation Reports for senior enlisted personnel in pay grade E-7 taken from a pool of approximately 1,000 performance evaluation report forms for two occupational ratings---Aviation Electronics Technician (AT) and Boilerman (BT). All 225 Evaluation Reports were drawn from the top half of the marking scale on 19A-PERFORMANCE OF DUTY located in the upper right quadrant of Evaluation Report Form NAVPER 1616/8. The 19A-PERFORMANCE OF DUTY category was used in preference to 19N-OVERALL EVALUATION because standard scores (T Scores) were available only for 19A. The use of standard scores rather than raw marks permitted a more refined selection to be made of the three criterion groups used in the study. Since raw marks on 19A correlate very highly with raw marks on 19N, it was felt that little was sacrificed by not using the overall evaluation and

---

<sup>\*</sup> This form subsequently has been replaced by another form that can be scanned by an optical character reader; however, the content of the two forms is essentially the same.

that much was gained by using the purified T Scores on 19A. Only those Evaluation Reports from commands spreading their marks and submitting eight or more E-7 and E-8 reports were considered.

The pilot study sample of 225 Evaluation Reports was divided equally into three criterion groups---Upper, Middle, and Lower---corresponding to three continuous segments of the upper half of the marking scale on 19A--PERFORMANCE OF DUTY. Table 1 shows the range of raw marks on 19A for each of the three criterion groups in the pilot study sample as well as the range and mean of T Scores. These standardized scores have a mean of 50 and a standard deviation of 10. Standardization was accomplished by setting each unit command mean equal to 50 and standardizing the total of E-7 and E-8 marks for each unit command. No cases from the bottom half of the marking scale on 19A were included in this study since there is no difficulty in differentiating these cases from the better performing personnel.

Table 2 shows the distribution of the 225 pilot study Evaluation Reports among the three criterion groups for each of the two occupational ratings and for both occupations combined. After the pilot study sample had been selected and analyzed, it was discovered that one Evaluation Report for an Aviation Antisubmarine Warfare Operator (AW) had erroneously been coded as an Aviation Electronics Technician (AT). This case was removed from the analysis by specific occupation but was left in the analysis for the total pilot study sample.

In the second study, NPRDC also selected the sample of Evaluation Reports to be analyzed. The same general procedures described above for selecting the pilot study sample were followed also in selecting the cross validation sample and the generalization sample, except that the forms were selected from a

subsequent year's data pool. The cross validation sample consisted of 222 Evaluation Reports from the same two ratings that were used in the pilot study, that is, Aviation Electronics Technician (AT) and Boilerman (BT). In addition, a generalization sample consisting of 222 Evaluation Reports was selected by NPRDC from two different ratings in order to ascertain the generalizability of the content analytic methodology developed in the pilot study. The two ratings from which the generalization sample was drawn were Commissaryman (CS) and Radioman (RM).

The cross validation sample of 222 Evaluation Reports and the generalization sample of 222 Evaluation Reports were both divided equally into the same three criterion groups as the pilot study sample---Upper, Middle, and Lower. Table 3 shows the range of raw marks on 19A for each of the three criterion groups in the cross validation sample (AT's and BT's), the range of T Scores, and the mean of the T Scores for each criterion group. These same data for the generalization sample (CS's and RM's) are presented in Table 4. Tables 5 and 6 show the distribution of the 222 cross validation sample Evaluation Reports and the 222 generalization sample Evaluation Reports among the three criterion groups for each of the two occupational ratings represented in each sample and for both occupations combined. Actual criterion group membership for the cross validation sample and the generalization sample was known only to NPRDC until the content analysis of the narrative text had been completed. Consequently, the content analysis of these two samples was conducted in the blind without benefit of knowing to which criterion group each Evaluation Report belonged.

### SECTION 3. CONTENT ANALYSIS METHODOLOGY

#### Conceptual Approach

In the pilot study, the narrative portions of the 75 Evaluation Reports for each of the three criterion groups were read in their entirety before formalizing the method of content analysis to be used. In this review the evaluation section and the justification section (19R and 19S) were considered separately. Borrowing from the field of information science, it seemed most appropriate to regard each narrative section as a short *document* that had been written by the ratee's senior officer in order to communicate to a selection board or to a detailee the potential that the ratee had for promotion and increased responsibility. Considered in this framework, the analysis task then becomes one of ascertaining what the *document* is about (content analysis), specification of the content by a set of descriptive labels (indexing), and organization of an indexing vocabulary (controlling the form and semantics of the descriptive labels by lexicon and/or rule).<sup>3,4</sup> In order for the content analysis to be valid, Fairthorne<sup>5</sup> cautions that two aspects must be taken into consideration: (a) what the *document* is about, and (b) the circumstances of the expected uses of the content analysis with respect to a particular task or problem. Fairthorne's advice was attended to in the design of the content analysis methodology in that the indexing vocabulary which was developed relates strongly to the ultimate use to which performance evaluations are put, that is, the selection for promotion of outstanding chief petty officers in the face of limited promotional opportunities.

#### The Indexing Vocabulary

In reading the narrative portions of the 75 Evaluation Reports for each of the three criterion groups in the pilot study sample, it became apparent that the attributes and characteristics being evaluated for a ratee related primarily to his potential as a manager and supervisor. Consequently, five references in the area of managerial behavior and practice<sup>6,7,8,9,10</sup> were consulted as an aid to the development of the indexing vocabulary used in this study. An initial vocabulary containing 41 descriptive labels was devised and used to test the adequacy and manageability of the indexing method on 20 Evaluation Reports not included in the pilot study sample but similar to them in content. As a result of this experience, the original set of 41 labels was condensed into a more generic set of 29 index terms. The indexing form, incorporating the final vocabulary that was used in both the pilot study and the second study, is shown in Figure 2.

The top line of the indexing form carries fields for an identifying number for each ratee, which criterion group he belongs to (used only in the pilot study since criterion data were withheld in the second study until the indexing had been completed), and whether the section being indexed is an evaluation section (19R) or a justification section (19S). The indexing form itself is divided into three major parts: MANAGEMENT FUNCTIONS, SKILLS AND ABILITIES, and PRODUCTIVITY AND ACHIEVEMENT. Under each of these headings there are more detailed terms, providing the indexer with a 3-level hierarchy of descriptive labels from which to choose.

Figure 2. Indexing Form Used in Performing the Content Analysis

The first section of the indexing form includes seven specific MANAGEMENT FUNCTIONS that many authorities on management practice agree are the characteristic duties of all managers.<sup>6,7,8,9,10</sup> Although some authorities believe that there are more, less, or different functions performed by managers, these seven functions were selected because they are representative of the duties that chief petty officers actually perform.

The second section of the indexing form contains index terms for 13 specific SKILLS AND ABILITIES considered to be important by Navy supervisory personnel in performing effectively as a chief petty officer. While some authorities on management practice consider making a judgment about whether or not an individual possesses a skill, quality, or ability to be a subjective process, Navy evaluators do repeatedly call out these specific qualities in their narrative evaluations because many of these qualities are dimensions on which they rate the ratee in Section 19 of the Evaluation Report. The first section of the indexing form---MANAGEMENT FUNCTIONS---deals with how a ratee performs his managerial functions and is result oriented, while the second section---SKILLS AND ABILITIES---contains index terms that relate to an individual's characteristics and qualities which, if used, may help him achieve good results.

The third section of the indexing form---PRODUCTIVITY AND ACHIEVEMENT---is the most result-oriented section of the indexing hierarchy. Here are included the measures of overall performance. DRIVE and SERVICE MOTIVATION (a specific type of drive) are included in this section since drive is considered to be one of the more important variables leading to success. POTENTIAL also is included here since potential is a measure of future performance. AWARDS AND PUNISHMENT, REPUTE, and ASSET TO THE NAVY represent acknowledgments of an individual's performance, either positive or negative acknowledgment.

Each sentence of narrative text in the pilot study sample and the cross validation and generalization samples was read carefully and, where appropriate, divided into segments corresponding to the assignment of specific index terms. However, it is not enough to simply label a narrative statement with the most appropriate index term since the statement may have been a highly positive, quite positive, neutral, quite negative, or highly negative one. For example, in order to differentiate between the ratee who plans superbly and the ratee who plans inadequately, a weighting scale was devised to be applied to each index term that is used (see Table 7). The weighting scale contains five numerical values ranging from 5 (the positive end of the scale) to 1 (the negative end of the scale). Under each numerical value in Table 7 there are listed samples of adjectives or adverbs that may be used by the rater to describe a ratee's performance. These lists of words provide clues to the indexer as to which numerical value to assign to an index term. As a simple example, if the rater commented that the ratee was highly cooperative, this statement would be indexed as COOPERATION and assigned a weight of 4 since *highly* is listed as an example under numeral 4 in Table 7.

The weighting scale developed for this content analysis research bears a marked resemblance to the quality rating scale developed by Harrington in rating narrative statements contained in letters of recommendation regarding candidates for secondary level teaching positions.<sup>11</sup> Harrington's quality rating scale was based upon the proposition that the favorableness of the modifying

NOTE: AWARDS AND PUNISHMENT is assigned a weight of either 5 or 1.

terms used by the writer of a recommendation is an index of his enthusiasm in recommending the candidate and, therefore, of the quality of the recommendation. The rationale for the weighting scale used in this study was similar to Harrington's proposition. A long list of adjectives and adverbs found to occur in a large corpus of Evaluation Reports were classified into five degrees of favorableness/unfavorableness in modifying terms. There is a great deal of overlap between the adjectives and adverbs contained in Harrington's quality rating scale and those contained in the weighting scale used in this research shown in Table 7. There also is a high degree of correspondence in the relative positioning of the adjectives and adverbs along the two scales. The existence of the fairly ancient Harrington monograph was not discovered until after the weighting scale used in this research had been devised and the research being reported had been completed. It is interesting that two research efforts conducted 30 years apart each independently developed a similar conceptual framework for performing a content analysis of narrative recommendations or evaluations. Harrington's procedure was identical to the one followed in the research being reported here. The narrative text of each Evaluation Report was read, segmented into distinct statements, and each statement was then assigned one or more index terms from the set of 29 possible choices shown in Figure 2. Each term selected was also assigned a numerical weight from 1 to 5 depending upon the nature of the adjectives or adverbs used as modifiers in the statement. The following examples will make more explicit the indexing procedure that was followed.

Example 1. "BTC has an excellent working and practical knowledge of the PMS System/but has a tendency to be lax in the administrative phase of the system."

This sentence was segmented into two parts. The first part was indexed as TECHNICAL SKILLS and assigned a weight of 5. The second part was indexed as MANAGEMENT FUNCTIONS and assigned a weight of 2.

Example 2. "Chief XX was relieved of his duties as the ship's Oil King after serving in the capacity for approximately two months./ He was removed from this billet because of his lack of professional knowledge/and technical know-how in the art of refueling."

This portion of narrative text was divided into three segments for indexing purposes. Segment 1 was indexed as AWARDS AND PUNISHMENT and assigned a weight of 1. Segment 2 was indexed as PROFESSIONALISM and assigned a weight of 2. Segment 3 was indexed as TECHNICAL SKILLS and assigned a weight of 2.

Example 3. "He is able to direct the efforts of Line Personnel in an efficient and effective manner;/this is reflected in the ratee by a multiple of exceptional qualities."

This sentence was segmented into two parts. The first part was indexed as LEADERSHIP AND DIRECTING and assigned a weight of 4. The second part was indexed as SKILLS AND ABILITIES and assigned a weight of 5.

Example 4. "His natural abilities/and responsible approach to recruiting/have enabled the ratee to outperform his contemporaries."

This sentence was segmented into three parts. The first part was indexed as SKILLS AND ABILITIES and assigned a weight of 3. The second part was indexed as RELIABILITY AND DEPENDABILITY and assigned a weight of 3. The third part was indexed as PRODUCTIVITY AND ACHIEVEMENT and assigned a weight of 4.

Figure 3 shows an example of the complete narrative text written in an evaluation section. The index terms that were selected by the indexer have been recorded above each segment of text and the indexing weights that were assigned appear directly after each term. Factual statements requiring no indexing were enclosed in brackets. The number of words in the narrative text were counted and recorded at the bottom of the text by the indexer.

After all of the narrative text for either an evaluation section or a justification section of an Evaluation Report was indexed, the weights corresponding to each term were written onto the indexing form to the right of the appropriate index term (see Figure 4). Thus there may have been two instances of mention of the ratee's INTELLECTUAL FUNCTIONING, the first mention given a weight of 3 and the second a weight of 4. To the right of INTELLECTUAL FUNCTIONING on the indexing form for this ratee would be written the following string of weights: 3,4. Then to the far right on the indexing form under the column headed "Freq." would be written "2", indicating that this index term had been used two times in indexing that particular section of narrative text.

At the bottom of the indexing form there is a line labeled FREQUENCY COUNTS. After all of the weights assigned to the index terms selected for a section of narrative text (19R or 19S) had been entered on the indexing form, all of the 5 weights were counted and the sum was entered to the right of 5 on the FREQUENCY COUNTS line. The same procedure was followed for entering the frequency count of 4 weights, 3 weights, 2 weights, and 1 weights. The final step in completing the indexing form was to transfer the total number of words written at the bottom of the narrative text and to count the total number of index terms selected from the set of 29 possibilities.

In order to increase the likelihood of consistent usage of the indexing vocabulary, a definition was written for each of the 29 index terms. Koontz and O'Donnell's *Principles of Management*<sup>7</sup> was relied upon heavily in defining the management-oriented terms listed in Figure 2. Also contributing to the formulation of the definitions for the 29 index terms was the way that Navy evaluators actually referred to these concepts in narrative text. These definitions were consulted frequently during the indexing process. Indexing of the pilot study sample and the cross validation and generalization samples was performed by one experienced indexer who also had conceptualized the content of the indexing vocabulary and had prepared the definitions of the 29 terms. As part of the concomitant study to ascertain the reliability of this content analysis methodology, a training manual was developed for use by the four reliability indexers participating in the study. This training manual is included in its entirety in Appendix A and incorporates an alphabetical dictionary of the 29 index terms. The dictionary definition for each term is followed by extensive examples of correct indexing usage of the term and the proper assignment of weights.

As Baxendale has so cogently articulated, "The core problem of content analysis concerns language in both its connotative and denotative aspects--a Pandora's box of semantic and psychological complexities and unknowns,"<sup>12</sup> Acknowledging these obstacles to a perfect representation of the content of a particular segment of narrative text, numerous examples of indexing usage have been included in the alphabetical dictionary of index terms, primarily as a means of illustrating the level of objectivity and consistency that can be achieved in this type of content analysis, but also to demonstrate the intractable problems that still reside in any effort to organize and objectify the domain of linguistic discourse.

<sup>INT FUN 3</sup> Ratee is an intelligent and proficient Petty Officer, who performs his duties  
<sup>MAN FUN 4</sup> in an outstanding manner. His ability to plan, organize, coordinate and super-  
<sup>PROD + ACH 5</sup> vise have been ably demonstrated by his performance as Recruit Company Command-  
<sup>PLAN 3</sup> er. Ratee is dependable, trustworthy, and exhibits mature judgment in dispos-  
<sup>ORG 3</sup> ing of problems which occur within his company. Ratee's military appearance  
<sup>LT 3</sup> and neatness of person and dress denote great pride. He is cheerful, highly  
<sup>PROD + ACH 3</sup> motivated, and gets along exceptionally well with others. Ratee's command of  
<sup>REL + DEP 3</sup> the English language, both orally and written is above average. Ratee is high-  
<sup>INT FUN 4</sup> ly recommended for E-8. [Ratee has been in Water Survival and Hygiene Division  
<sup>CR + AT 3</sup> only for a short period of time.] He has shown a great potential towards being  
<sup>TRID 4</sup> a swimming instructor. Ratee is practicing on his own time to qualify for  
<sup>COND 3</sup> Senior Life Saver.

#### SECTION 4. STATISTICAL ANALYSIS AND RESULTS

A set of 67 quantitative variables was derived from the indexing form used in the content analysis (see Table 8). The first 29 variables reflect the simple frequency with which each index term was used to index a particular section of narrative text. Variable 30 is the sum of these 29 frequencies. Variables 31 through 59 represent the *weighted* frequency of each index term used to index a particular section of narrative text. For example, suppose that the index term CONTROLLING was used twice. The first time that it was used it was assigned a weight of 4; the second time that it was used it was assigned a weight of 3. The weighted frequency then for CONTROLLING would be  $4 \times 1 + 3 \times 1 = 7$ . The simple frequency for this same example would be  $1 + 1 = 2$ . Variable 60 is similar to Variable 30 in that it is the sum of the 29 weighted frequencies.

Variables 61 through 65 represent the frequency counts over the entire indexing form for all 5 weights, 4 weights, 3 weights, 2 weights, and 1 weights. Variable 66 is the total number of words in the section of narrative text that was indexed. Variable 67 is the total number of index terms of the 29 available that were used to index the section of narrative text.

Profiles or vectors of these 67 values then were prepared for all of the Evaluation Reports contained in each sample. Separate profiles were compiled for the evaluation and justification sections of each Evaluation Report. If certain index terms were not used at all in indexing the evaluation section narrative or the justification section narrative, they were given a value of zero in the profile. This practice raised an important theoretical issue. Is it more damaging not to say anything about a ratee's performance in a particular area than to damn him with qualified praise? A statement such as the following was assigned a weight of 2: "With more time and conscientious effort, he should realize a greater potential." This evaluation of the ratee's potential seems more negative than not to have commented at all about his potential.

As a result of these considerations, the weighting scale that had been used in the indexing of Variables 31 through 59 was transformed in order to place no comment between positive comments and negative comments. Table 9 shows the conversion that was used. A constant of 10 was added to the weighted frequency of Variables 31 through 59 in order to avoid the incidence of any negative input values in the subsequent statistical computations.

All profiles were transformed to the new weighting scale and entered onto IBM coding forms in preparation for keypunching. The criterion data and occupational rating codes were known for the pilot study sample and were included on the coding forms. However, all of the coding forms for the cross validation sample and the generalization sample were sent to the Navy Personnel Research and Development Center in San Diego where the criterion data and occupational rating codes were added to the coding forms and then returned to R-K Research and System Design for keypunching at UCLA. Card decks for each of the three samples were assembled in six parts: (1) Upper Criterion Group - Evaluation Section, (2) Middle Criterion Group - Evaluation Section, (3) Lower Criterion Group - Evaluation Section, (4) Upper Criterion Group - Justification Section, (5) Middle Criterion Group - Justification Section, and (6)

Lower Criterion Group - Justification Section. Duplicate card decks were sent to NPRDC.

In order to better visualize the nature of the distributions of the 67 variables for each of the three research samples, computer runs were made at the UCLA Health Sciences Computing Facility\* using Program BMD01D of the library of Biomedical Computer Programs.<sup>13</sup> Program BMD01D - Simple Data Description computes arithmetic means, standard deviations, standard errors of means, maximum values, minimum values, ranges, and sample sizes for a set of input variables. The output from these computer runs for the cross validation sample and the generalization sample is presented in Appendix B. The output from the computer run for the pilot study sample was included in an earlier technical report,<sup>14</sup> and since it is rather voluminous, it is not repeated in this report.

Some interesting comparisons can be made from the descriptive statistics compiled in Appendix B. Tables 10 and 11 present the data on Variable 66, total number of words contained in the narrative text of the evaluation and justification sections of the Evaluation Report, Table 10 for the cross validation sample and Table 11 for the generalization sample. The results for the evaluation sections of Tables 10 and 11 are different from those found in the pilot study<sup>15</sup> where the nearer that the criterion group was to the top of the distribution of T Scores on 19A-PERFORMANCE OF DUTY, the longer the narrative text written to evaluate the performance of the ratee. In the pilot study sample approximately 89 words were written on the average to evaluate ratees in the Upper criterion group. This average dropped to approximately 76 words in the Middle criterion group and to approximately 67 words in the Lower criterion group. This decreasing trend is not apparent in Tables 10 and 11 for the evaluation section. Instead, in the cross validation sample the trend is just the opposite, with the average length of the narrative text of the evaluation section becoming longer as the criterion group moves farther away from

Lower	27.4051	40.0231	172	0	172

the top of the distribution of T Scores on 19A. In the generalization sample the average length of the narrative text of the evaluation section drops from the Upper criterion group to the Middle criterion group but then rises even higher for the Lower criterion group than for the Upper criterion group. These unexpected findings for the cross validation and generalization samples can be explained by the presence of a few atypically long evaluation sections in the Middle and Lower criterion groups that markedly influenced the mean length for these two criterion groups. This explanation is further corroborated by examining the maximum total number of words contained in the narrative text of the evaluation section for the Lower criterion group as shown in Tables 10 and 11. A minimum of zero words resulted from evaluation sections not being written at all for a handful of cases in the various criterion groups.

In the pilot study the trend of longer narrative text for criterion groups near the top of the distribution of T Scores on 19A-PERFORMANCE OF DUTY prevailed also for the justification section, but the effect was even more pronounced than for the evaluation section. This same outcome resulted for the justification section in the cross validation and generalization samples, and can be explained partly by the requirement to write an individual justification in Section 19S for any mark given in the top 10, 5, or 1% columns of Section 19. When a justification section was written, on the average it was longer than the evaluation section in the Upper and Middle criterion groups of all three samples.

Tables 12 and 13 also extract data from Appendix B and present descriptive statistics for all three criterion groups in the cross validation and generalization samples on Variable 67, total number of index terms used of the 29 available to index the evaluation and justification sections of the Evaluation Report. The results shown in Tables 12 and 13 are correlated to those presented in Tables 10 and 11 in that the number of index terms used is a function of length of the narrative text. As the evaluator uses more words to describe the ratee, he is more likely to comment on a wider variety of specific areas of the ratee's performance. This tendency is mirrored in the number of different index terms selected by the indexer to encompass the narrative content. It is interesting that on the average in the evaluation section of either the cross validation or the generalization sample only a half dozen substantive areas of the ratee's performance were described of the 29 possibilities. This was also the finding in the pilot study.<sup>16</sup> Even in the justification section where longer expositions were written, on the average only 11 or 12 of the 29 content areas were mentioned in the Upper criterion group (nine areas in the pilot study Upper criterion group<sup>16</sup>). This finding, consistent across all three samples, suggests that the evaluators may be victims of habitual ways of formulating and phrasing the narrative sections of the Evaluation Report. Of the richness of information that could be used to describe the performance of ratees in the Upper criterion group, on the average only a partial representation is utilized. All of the 29 index terms were used at one time or another to index the evaluation sections or the justification sections of the three criterion groups in all three samples. Therefore, one can conclude that although only a partial representation of the 29 substantive areas may be utilized to describe a particular ratee, over a sample as large as any one criterion group (N=74 or 75), all 29 areas of performance do get mentioned at one time or another.

From the duplicate deck of punched cards for the cross validation and the generalization samples that was sent to NPRDC, correlation matrices were computed at the computing facility of the Naval Electronics Laboratory Center in San Diego. Correlations among all 67 variables for the evaluation section and for the justification section were computed for each sample as well as the matrix correlating the evaluation section with the justification section on all 67 variables. These results are displayed in Appendix C. The reader is referred to Table 8 for a definition of each of the 67 variables.

The overall picture that emerges from a scrutiny of these six matrices is that there are very few high correlations except for the correlations between Variables 1 through 30 and Variables 31 through 60 which are shown in italic type. These two sets of variables are the same except for the method of weighting that was used. The other variables that showed a consistently high correlation in the evaluation section and also in the justification section for both samples were Variable 30 (Sum of Variables 1 through 29) and Variable 60 (Sum of Variables 31 through 59) with Variable 61 (Total Number of 5 [New 3] Weights), Variable 62 (Total Number of 4 [New 2] Weights), Variable 63 (Total Number of 3 [New 1] Weights), Variable 66 (Total Number of Words in the Narrative Text), and Variable 67 (Total Number of Index Terms Used). Variable 67 (Total Number of Index Terms Used) is a focal variable, correlating highly with Variable 30 (Sum of Variables 1 through 29), Variable 60 (Sum of Variables 31 through 59), Variable 61 (Total Number of 5 [New 3] Weights), Variable 62 (Total Number of 4 [New 2] Weights), Variable 63 (Total Number of 3 [New 1] Weights), and Variable 66 (Total Number of Words in the Narrative Text). Correlations among the variables having to do with the 29 index terms per se were notably low, indicating that these 29 dimensions are relatively orthogonal and represent independent aspects of managerial performance. In the correlation matrix for the evaluation section versus the justification section, no high correlations were evident in either the cross validation sample or the generalization sample, demonstrating that these two narrative sections of Evaluation Report Form NAVPERS 1616/8 are quite independent and should be treated separately. An early decision in this research project was to treat these two narrative sections separately; in retrospect this determination appears to have been a wise decision.

Since the system that was used for weighting Variables 31 through 59 has been highlighted by the correlational analysis as an important aspect of the content analysis methodology, it is of interest to see the distribution of index weights used for each of the three criterion groups in the cross validation and generalization samples. These results are presented in Tables 14 through 17. Tables 14 and 15 show the distribution for the cross validation sample, first for the evaluation section and then for the justification section. Comparable distributions for the generalization sample are shown in Tables 16 and 17. A chi square test of common distribution was calculated for all pairwise criterion group comparisons in Tables 14 through 17 in order to test the hypothesis that the distributions of index weights used for each pair of groups were drawn from the same population. This hypothesis was rejected beyond the .001 level of probability for five of the six comparisons made for the cross validation sample (see Table 18). For the comparison of the Upper versus Middle criterion groups on the justification section, the hypothesis was rejected beyond the .01 level of probability. These results replicate the

findings in the earlier pilot study.<sup>17</sup> For the generalization sample the hypothesis was rejected beyond the .001 level of probability for all three comparisons made for the evaluation section (see Table 19). However, in the justification section the difference between the distributions of weights for the Upper versus Middle criterion groups was not statistically significant. The other two comparisons (i.e., Middle vs. Lower and Upper vs. Lower) were statistically significant. The conclusion that can be drawn from Tables 14 through 19 is that the higher the criterion group, the more excellent and good attributes that are mentioned by the evaluator. The lower the criterion group, the more average, poor, and poorest incidents of behavior that are cited by the evaluator.

In the pilot study the Mann-Whitney U test was used to test the null hypothesis that there were no differences between each pair of criterion groups on each of the 67 quantitative variables derived from the indexing form. The nonparametric Mann-Whitney U test was used in preference to the parametric *t* test of difference between two means because very few of the 67 variables were normally distributed and the *t* test assumes normality and common variance. However, since the *t* test is very robust, it was decided subsequently to also compute *t* tests of mean difference for the pilot study sample using Program BMDP3D in the library of Biomedical Computer Programs<sup>13</sup> at the UCLA Health Sciences Computing Facility. The results of these computer runs agreed substantially with the results obtained using the Mann-Whitney U test, primarily because the sample size of the various criterion groups in the pilot study sample was equal and large ( $N=75$ ). The probability level of these two statistical tests differed occasionally and only when the result fell near the boundary of the various bench marks of statistical significance (e.g., the *t* test might be significant between the .01 and .001 probability levels and the Mann-Whitney U test might be significant between the .05 and .01 probability levels).

As a consequence of the pilot study experience, both the Mann-Whitney U test and the *t* test of mean difference were computed on each of the 67 variables for the cross validation and generalization samples. These computations were made for each pair of criterion groups in both the evaluation and the justification sections. The Mann-Whitney U tests were performed at the computing facility of the Naval Electronics Laboratory Center in San Diego under the supervision of NPRDC. The *t* tests were performed at the UCLA Health Sciences Computing Facility. The results of these computer runs are presented in Appendix D. This appendix reports the number and name of the variable, the value of U, its associated absolute *z* value (approximately a normal deviate), and the corresponding probability level for a 2-tailed test. The convention that was followed in the Mann-Whitney U tests was to enter data into the computer program first for the lower criterion group in the comparison. For those *z* values that achieved statistical significance, the direction of the difference is that the higher criterion group evidenced a greater frequency or greater weighted frequency of the variable. The Mann-Whitney U test probability level in Appendix D is followed by the value of *t* and its probability level for a 2-tailed test. Thus the reader can compare the results of the two statistical tests for each variable.

Those variables resulting in a statistically significant difference in each pairwise criterion group comparison have been extracted from Appendix D

and summarized in four tables---Tables 20 through 23. Only those variables showing a significant difference on both statistical tests have been extracted. Table 20 lists the statistically significant variables for the evaluation section of the cross validation sample. The easiest discrimination to be made should be between the Lower and Upper criterion groups since they are the most widely separated on the criterion variable 19A-PERFORMANCE OF DUTY. Table 20 reveals that eight of the 67 variables showed a statistically significant difference between the Lower and Upper criterion groups. Seven of these eight variables also showed a statistically significant difference between the Lower and Upper criterion groups in the pilot study sample,<sup>18</sup> the exception being Total Number of 3 (New 1) Weights (Average). In evaluating the performance of outstanding chief petty officers as compared to average CPO's, the significant differences reside in the superiority of the top criterion group with respect to professionalism, managerial know-how, more awards and fewer punishments, more superlative attributes, and fewer qualified statements reflecting fair or poor performance.

By comparison Table 20 shows that there were eleven statistically significant differences between the Lower and Middle criterion groups of the cross validation sample on the evaluation section. Only one of these eleven variables showed a statistically significant difference between the Lower and Middle criterion groups in the pilot study sample---Total Number of 2 (New -1) Weights (Poor).<sup>18</sup> In the cross validation sample the areas of performance that differentiated average CPO's from those who are marked as somewhat superior in performance of duty were professionalism, cooperation, responsiveness, resourcefulness, and productivity and achievement. Ratees in the middle criterion group were described with more superlatives and with fewer qualified statements of fair or poor performance.

The most difficult discrimination to be made is that between the Middle and Upper criterion groups. Table 20 shows that despite this difficulty, eight statistically significant differences resulted from the comparison on the evaluation section. Only two of these eight variables showed a statistically significant difference between the Middle and Upper criterion groups in the pilot study sample---f of COOPERATION and wf of COOPERATION.<sup>18</sup> In the cross validation sample the characteristics that differentiated outstanding CPO's from their slightly less qualified colleagues were cooperation, grooming and attire, resourcefulness, and productivity and achievement. A wider range of index terms was used to index the Evaluation Reports of outstanding CPO's which also resulted in more 3 (New 1) weights being assigned to this criterion group.

Moving now to a consideration of the justification section for the cross validation sample (Table 21), all but five of the 67 variables showed a statistically significant difference between the Lower and Upper criterion groups and all but eight of the 67 variables showed a statistically significant difference between the Lower and Middle criterion groups. This plethora of significant results is an artifact occasioned by the requirement to write an individual justification for any mark in the top 10, 5, or 1% columns of Section 19. Despite this built-in bias, five of the 67 variables were not statistically significant for the Lower versus Upper criterion group comparison: f of FLEXIBILITY, wf of FLEXIBILITY, wf of ORGANIZATION, Total Number of 2 (New -1)

Weights (Poor), and Total Number of 1 (New -2) Weights (Poorest). No 2 or 1 weights were used in indexing the Upper criterion group and only two 2 weights and one 1 weight were used in indexing the Lower criterion group (see Table 15). Eight of the 67 variables were not statistically significant for the Lower versus Middle criterion group comparison: f of ENDURANCE, wf of ENDURANCE, f of FLEXIBILITY, wf of FLEXIBILITY, f of AWARDS AND PUNISHMENT, wf of INTELLECTUAL FUNCTIONING, Total Number of 2 (New -1) Weights (Poor), and Total Number of 1 (New -2) Weights (Poorest). Only two 2 weights and no 1 weights were used in indexing the Middle criterion group compared to two 2 weights and one 1 weight for the Lower criterion group (see Table 15).

The only really cogent comparison for the justification section is between the Upper and the Middle criterion groups because both of these groups required justification comments. Table 21 shows that 21 of the 67 variables evidenced a statistically significant difference between these two criterion groups, eight of which also showed a statistically significant difference between the Upper and Middle criterion groups in the pilot study sample---wf of SKILLS AND ABILITIES, f of PRODUCTIVITY AND ACHIEVEMENT, wf of PRODUCTIVITY AND ACHIEVEMENT, Sum of Variables 1 through 29, Sum of Variables 31 through 59, Total Number of 5 (New 3) Weights, Total Number of Words in Text, and Total Number of Index Terms Used.<sup>19</sup> When the evaluator is required to justify his marks in evaluating a ratee, he apparently calls out certain areas of performance that distinguish the ratee in the Upper criterion group from his slightly less qualified colleague in the Middle criterion group. In the cross validation sample skills and abilities as well as productivity and achievement were the differentiating areas of performance. The ratee in the Upper criterion group also had bestowed upon him more superlative adjectives and adverbs. All three criterion group comparisons on the justification section of the Evaluation Report showed significant differences on both Total Number of Words in Text and Total Number of Index Terms Used.

Table 22 lists the statistically significant variables for the evaluation section of the generalization sample. Again, the easiest discrimination to be made should be between the Lower and Upper criterion groups since they are the most widely separated on the criterion variable 19A-PERFORMANCE OF DUTY. Only four of the 67 variables showed a statistically significant difference between the Lower and Upper criterion groups---f of AWARDS AND PUNISHMENT, wf of AWARDS AND PUNISHMENT, Total Number of 5 (New 3) Weights (Excellent), and Total Number of 2 (New -1) Weights (Poor). All four of these variables also showed a statistically significant difference between the Lower and Upper criterion groups on the evaluation section of the cross validation sample.

By comparison Table 22 shows that there were six statistically significant differences between the Lower and Middle criterion groups of the generalization sample on the evaluation section. Only one of these six variables also showed a statistically significant difference between the Lower and Middle criterion groups on the evaluation section of the cross validation sample---Total Number of 2 (New -1) Weights (Poor). Four statistically significant differences resulted from the comparison between the Middle and Upper criterion groups on the evaluation section of the generalization sample---f of POTENTIAL, wf of POTENTIAL, Total Number of 5 (New 3) Weights (Excellent), and Total Number of 2 (New -1) Weights (Poor). None of these four variables overlapped with those

that were statistically significant for the Middle versus Upper criterion group comparison on the evaluation section of the cross validation sample. These results may indicate that the findings in the cross validation sample may not map particularly well onto the findings in the generalization sample, probably because of the differences in the occupational ratings represented in these two samples. This issue will be dealt with more thoroughly later in this section when the results of the stepwise discriminant analyses are discussed.

Moving now to a consideration of the justification section for the generalization sample (Table 23), all but nine of the 67 variables showed a statistically significant difference between the Lower and Upper criterion groups. Four of these nine variables also showed a lack of statistical significance between the Lower and Upper criterion groups on the justification section of the cross validation sample---f of FLEXIBILITY, wf of FLEXIBILITY, Total Number of 2 (New -1) Weights (Poor), and Total Number of 1 (New -2) Weights (Poorest). All but 15 of the 67 variables showed a statistically significant difference between the Lower and Middle criterion groups on the justification section of the generalization sample (Table 23). Five of these 15 variables also showed a lack of statistical significance between the Lower and Middle criterion groups on the justification section of the cross validation sample---f of FLEXIBILITY, wf of FLEXIBILITY, f of AWARDS AND PUNISHMENT, Total Number of 2 (New -1) Weights (Poor), and Total Number of 1 (New -2) Weights (Poorest).

As pointed out earlier, the only really cogent comparison for the justification section is between the Upper and the Middle criterion groups because both of these groups required justification comments. Table 23 shows that 38 of the 67 variables evidenced a statistically significant difference between these two criterion groups in the generalization sample, 17 of which also showed a statistically significant difference between the Upper and Middle criterion groups in the cross validation sample. This finding suggests that there is partial overlap between these two samples. The nonoverlapping areas may be attributed to a difference in the nature of the occupational ratings represented in the cross validation and the generalization samples and/or to unreliability in the indexing procedure, although the results of the reliability study presented in Section 5 suggest that differences among the four occupational ratings provide a more reasonable explanation for these results than unreliability. Both of these issues will be discussed more fully later in this report.

In every pairwise criterion group comparison shown in Tables 20 through 23, one or more of the five variables involving Total Number of 5 (New 3), 4 (New 2), 3 (New 1), 2 (New -1), or 1 (New -2) Weights proved to be significantly differentiating. This finding supports the results of the correlational analysis presented in Appendix C in which the system used for weighting Variables 31 through 59 was highlighted as an important aspect of the content analysis methodology.

Thus far in this report the 67 quantitative variables derived from the indexing form have been considered individually as potential discriminators among the three criterion groups in the evaluation and justification sections of the various samples. However, it is of considerable interest to learn how well this set of variables, used in optimal combination, can classify each of

the research samples into correct criterion group. Therefore, the three samples were also analyzed by Program BMD07M in the library of Biomedical Computer Programs<sup>13</sup> at the UCLA Health Sciences Computing Facility. This program performs a multiple discriminant analysis in a stepwise manner. At each step one variable is entered into the set of discriminating variables or a variable is deleted if its F value becomes too low. At the option of the user, a classification matrix is computed and printed after those steps specified by the user. This option permits the user to determine if the classification process tends to converge to perfect classification or to maximize at some midway step and then disintegrate as more variables are added to the discriminant function.

A special feature of Program BMD07M allows new cases to be classified by the discriminant functions generated on the original sample. This feature was used to perform two cross validation studies of the AT's and BT's combined and also of the AT's and BT's considered separately. In the first study, the cross validation sample and the pilot study sample were both classified using the cross validation sample discriminant functions. In the second study, the pilot study sample and the cross validation sample were both classified using the pilot study sample discriminant functions. Figure 5 portrays the accuracy of classifying the cross validation sample and the pilot study sample into correct criterion group using the cross validation sample discriminant functions for the evaluation section (19R). For the first three steps of the discriminant analysis the curves for the two samples are very close. Then, as the discriminant analysis progresses step by step, the two curves begin to separate with the accuracy of classifying the pilot study sample being considerably less than the accuracy of classifying the cross validation sample. It was expected, of course, that classification of the pilot study sample using the cross validation sample discriminant functions would be less accurate than classification of the cross validation sample itself. Nonetheless, the pilot study sample curve tracks the behavior of the cross validation sample curve quite faithfully and even drops off precipitously at Step 64 as classification of the cross validation sample disintegrates. Figure 6 portrays the accuracy of classifying the cross validation sample and the pilot study sample into correct criterion group using the cross validation sample discriminant functions for the justification section (19S). As in Figure 5 the curves for the two samples remain very close for the first five steps after which they begin to diverge. Again, less accuracy was achieved in classifying the pilot study sample using the cross validation sample discriminant functions than in classifying the cross validation sample itself. However, it should be noted that for both samples better classification accuracy was achieved on the justification section than on the evaluation section. This is more clearly shown in Table 24.

Table 24 displays the best classification that was achieved on the evaluation section and the justification section of the cross validation sample and the pilot study sample using the cross validation sample discriminant functions. The underlined diagonal elements of the four classification matrices portrayed in Table 24 represent agreement between the statistical classification into criterion group and actual criterion group membership; the off-diagonal elements represent disagreement. The total number of statistical classifications matching actual classification is obtained by summing the diagonal elements of each matrix, shown in Table 24 as the underlined diagonal sum. The step in the discriminant analysis at which this best classification

## JUSTIFICATION SECTION - 19S

CROSS VALIDATION SAMPLE (N=222)					PILOT STUDY SAMPLE (N=224)				
Actual Criterion Group Membership	Step 40	Classification by Discriminant Analysis			Step 4	Classification by Discriminant Analysis			
		UPPER	MIDDLE	LOWER		UPPER	MIDDLE	LOWER	
	UPPER	<u>58</u>	15	1	UPPER	<u>43</u>	21	11	
	MIDDLE	8	<u>61</u>	5	MIDDLE	15	<u>45</u>	14	
	LOWER	0	4	<u>70</u>	LOWER	0	5	<u>70</u>	
		Diagonal Sum = <u>189</u>				Diagonal Sum = <u>158</u>			

was achieved is also shown in Table 24 and corresponds to the maximum point on the curves shown in Figures 5 and 6. Of the 222 cases in the cross validation sample, 189 (85%) were classified correctly at Step 40 in the discriminant analysis of the justification section of the cross validation sample. Of the 224 cases in the pilot study sample, 158 (71%) were classified correctly on the justification section with the cross validation sample discriminant functions, this maximum classification accuracy occurring at the fourth step. It should be pointed out that this presentation of the discriminant analysis results assumes that the criterion of actual group membership is perfect where in fact the possibility does exist that some of the members of the sample were given inflated marks on 19A-PERFORMANCE OF DUTY, and consequently, were assigned to an incorrect criterion group. Also, it is possible that narrative comments and evaluation marks may tap different aspects of performance.

Figures 7 and 8 portray the accuracy of classifying the pilot study sample and the cross validation sample into correct criterion group using the pilot study sample discriminant functions. Figure 7 shows these results for the evaluation section (19R) and Figure 8 shows them for the justification section (19S). As in the reverse cross validation shown in Figures 5 and 6, the two curves remain close together for the first five steps or so and then they diverge with the pilot study sample being classified more accurately on its own discriminant functions than the cross validation sample. Once again better classification accuracy was achieved for both samples on the justification section. This is shown more clearly in Table 25. Of the 224 cases in the pilot study sample, 200 (89%) were classified correctly at Step 42 in the discriminant analysis of the justification section of the pilot study sample. Of the 222 cases in the cross validation sample, 149 (67%) were classified correctly on the justification section with the pilot study sample discriminant functions, this maximum classification accuracy occurring at the third step.

It was hypothesized that better classification would be achieved in using Program BMD07M if the two occupational ratings represented in each of the three research samples were analyzed separately. The skills needed to achieve superior performance may be quite different for Aviation Electronics Technicians than for Boilermen. Therefore, two cross validation studies also were conducted for the AT's and for the BT's. Figures 9 and 10 portray the accuracy of classifying the cross validation AT's and the pilot study AT's into correct criterion group using the cross validation AT's discriminant functions. Figure 9 shows these results for the evaluation section (19R) and Figure 10 shows them for the justification section (19S). In both of these figures the two curves remain close together in the earlier steps and then diverge with the cross validation AT's being classified more accurately on their own discriminant functions than the pilot study AT's. As in the total cross validation and pilot study samples, better classification accuracy was achieved for both samples on the justification section. Table 26 shows this more clearly. Of the 138 cross validation AT's, 129 (93%) were classified correctly at Step 46 in the discriminant analysis of the justification section for the cross validation AT's. Of the 144 pilot study AT's, 96 (67%) were classified correctly on the justification section with the cross validation AT's discriminant functions, this maximum classification accuracy occurring on the first step.

The results of the reverse cross validation for the pilot study AT's and the cross validation AT's are shown in Figures 11 and 12. Figure 11 portrays the accuracy of classifying the pilot study AT's and the cross validation AT's into correct criterion group on the evaluation section using the pilot study AT's discriminant functions. Figure 12 depicts parallel results for the justification section. It now seems abundantly clear that the two curves remain close together over the first five steps or so and then diverge. The curve for the sample classified by its own discriminant functions continues to rise to some maximum point of classification accuracy, usually between Steps 40 and 50. The best classification accuracy for the sample being classified by the other sample's discriminant functions is achieved very early, typically before Step 5 after which the classification accuracy begins to deteriorate and the two curves diverge. Comparing Figure 11 with Figure 12 it can be seen again that better classification accuracy was achieved for both samples on the justification section. Table 27 presents the classification matrices illustrating this outcome more clearly. Of the 144 pilot study AT's, 137 (95%) were classified correctly at Step 58 in the discriminant analysis of the justification section for the pilot study AT's. Of the 138 cross validation AT's, 91 (66%) were classified correctly on the justification section with the pilot study AT's discriminant functions, this maximum classification accuracy occurring on the third step.

Two cross validation studies also were conducted for the cross validation BT's and the pilot study BT's, and the results from these studies continue to support the picture that has already emerged. Figure 13 portrays the accuracy of classifying the cross validation BT's and the pilot study BT's into correct criterion group on the evaluation section using the cross validation BT's discriminant functions. Parallel results for the justification section are shown in Figure 14. Perfect classification accuracy was achieved on the justification section at Step 46 for the 84 cross validation BT's using their own discriminant functions (see Table 28). Of the 80 pilot study BT's, 54 (68%) were classified correctly on the justification section with the cross validation BT's discriminant functions, this maximum classification accuracy occurring at Step 8.

In the reverse cross validation for the pilot study BT's and the cross validation BT's classified by the pilot study BT's discriminant functions, the results are similar. Figure 15 portrays the curve of classification accuracy for the evaluation section and Figure 16 depicts the classification accuracy curve for the justification section. Table 29 presents the four classification matrices corresponding to Figures 15 and 16 in which the best classification achieved is portrayed. All 80 pilot study BT's were classified correctly on the justification section by their own discriminant functions. Of the 84 cross validation BT's, 55 (65%) were classified correctly on the justification section with the pilot study BT's discriminant functions, this maximum classification accuracy occurring at the first step.

The results of the two cross validation studies were very similar for the total cross validation sample and the total pilot study sample, for the cross validation AT's and the pilot study AT's, and for the cross validation BT's and the pilot study BT's. These findings support the expectation held at the outset of this investigation that it would be possible to index the cross

validation sample in the blind, without knowledge of criterion group membership, and achieve as good classification accuracy as was achieved with the pilot study sample where criterion group membership was known to the indexer. Further, it can be concluded that better classification into the three criterion groups using an optimum combination of the 67 quantitative variables is achieved when the two occupational ratings represented in the pilot study sample and the cross validation sample are treated separately. The superior classification accuracy achieved for the BT's compared to the AT's indicates that the Aviation Electronics Technician rating may represent a more varied amalgamation of technical activities than the Boilerman rating. These findings suggest that classification procedures based on the content analysis methodology developed in this research should be tailored to specific occupations. In all of the results presented thus far, better classification was achieved in the discriminant analyses of the justification section compared to the evaluation section. In the various cross validation runs reported, it appears that the best classification accuracy that can be achieved on a second sample using discriminant functions developed on the first sample is 65 to 70 percent. This level of accuracy is achieved early in the stepwise discriminant analysis procedure, typically by the fifth step. This finding suggests that the variables selected by the discriminant analysis program at the first five steps are crucial variables. Later in this section the variables selected for the first 15 steps in each of the cross validation runs will be enumerated. But before turning to this enumeration, the results in classifying the generalization sample (CS's and RM's) will be discussed.

Discriminant analyses also were performed for the CS's and RM's combined (the total generalization sample) as well as for each of these two occupational ratings separately. The accuracy of classifying the generalization sample into correct criterion group is shown in Figures 17 and 18, first for the evaluation section and then for the justification section. Better classification accuracy was achieved for the justification section (see Table 30) than for the evaluation section where 190 of the 222 cases (86%) in the justification portion of the generalization sample were classified correctly.

When the CS's and RM's were considered separately, better classification accuracy was achieved. Referring to Table 30, 58 of the 60 generalization CS's (97%) were classified correctly on the evaluation section. All 60 generalization CS's were classified correctly on the justification section. The curves depicting the accuracy of classifying the CS's on both the evaluation section and the justification section are shown in Figures 19 and 20. The 162 RM's in the generalization sample were not classified as accurately as the CS's, although better classification accuracy for the RM's was achieved on the justification section where 144 cases were classified correctly (89%). These results are shown in Table 30. The curves portraying the accuracy of classifying the RM's on both the evaluation section and the justification section are shown in Figures 21 and 22. Again the superiority of the justification section in providing discriminating narrative comments is demonstrated. On the justification section all 60 CS's were classified correctly by their discriminant functions and 89 percent of the RM's were classified correctly by their discriminant functions. Eighty-six percent of the total generalization sample was classified correctly on the justification section by the discriminant functions based on CS's and RM's combined. This suggests that the occupational rating,

Radioman, may be more heterogeneous and require a greater variety of skills than the Commissaryman rating just as the Aviation Electronics Technician rating may represent a more varied amalgamation of technical activities than the Boilerman rating. The case for treating each occupational rating separately seems to be supported additionally by the classification results for the generalization sample. Moreover, it is evident that the content analysis methodology developed initially on the pilot study sample consisting of AT's and BT's was generalizable to a new sample consisting of two different occupational ratings, viz., CS's and RM's.

A most interesting set of results is revealed by an examination of which variables were selected by the stepwise discriminant analysis program for the first 15 steps in each of the computer runs that were made. Tables 31 and 32 show the results for the total cross validation sample (AT's and BT's combined) and the total pilot study sample (AT's and BT's combined). The results are presented separately for the evaluation section and the justification section. If the variable was one of the first 15 variables selected in both of the samples for each section considered separately, it has been flagged with an asterisk in Tables 31 and 32. Therefore, it can be determined quickly that six of the first 15 variables selected by the stepwise discriminant analysis program in the cross validation sample and the pilot study sample for the evaluation section were the same, namely, Total Number of 5 (New 3) Weights, Total Number of 2 (New -1) Weights, f of COOPERATION, wf of AWARDS AND PUNISHMENT, f of LEADERSHIP AND DIRECTING, and wf of TECHNICAL SKILLS. Furthermore, Total Number of 5 (New 3) Weights was the first variable selected in both samples for the evaluation section, with Total Number of 2 (New -1) Weights being the second variable selected in the pilot study sample and the third variable selected in the cross validation sample. It appears that the incidence of superlative adjectives and adverbs describing excellent performance (5 Weights) and the incidence of negatively comparative adjectives and adverbs describing inadequate performance (2 Weights) constitute key discriminating variables in analyzing the content of narrative comments written for the evaluation section in these two samples.

Of more interest is the justification section since without exception better classification was achieved in the content analysis of the narrative comments written for the justification section. Four of the first 15 variables selected by the stepwise discriminant analysis program for the justification section in the total cross validation sample (AT's and BT's combined) and the total pilot study sample (AT's and BT's combined) were the same. Total Number of Index Terms Used was the first variable selected in both samples. Sum of Variables 1 through 29 was the second variable selected in the cross validation sample and the fourth variable selected in the pilot study sample. wf of PRODUCTIVITY AND ACHIEVEMENT was the third variable selected in the pilot study sample and the fourth variable selected in the cross validation sample. f of DRIVE was the fifth variable selected in the pilot study sample and the seventh variable selected in the cross validation sample.

Similar tables of results also were prepared for the AT's and BT's considered separately in the cross validation and pilot study samples. Tables 33 and 34 show the first 15 variables selected by the stepwise discriminant analysis program for the cross validation AT's and the pilot study AT's in the evaluation and justification sections. As in Tables 31 and 32, an asterisk

denotes variables within each section that were selected in both samples. On the evaluation section, five of the first 15 variables selected were the same for the cross validation AT's and the pilot study AT's. As expected, Total Number of 5 (New 3) Weights and Total Number of 2 (New -1) Weights were among these five variables. On the justification section, two of the first 15 variables selected were the same for the cross validation AT's and the pilot study AT's. Again, Total Number of Index Terms Used was the first variable selected for both the cross validation AT's and the pilot study AT's.

Tables 35 and 36 show the first 15 variables selected by the stepwise discriminant analysis program for the cross validation BT's and the pilot study BT's in the evaluation and justification sections. Again, an asterisk denotes variables within each section that were selected in both samples. On the evaluation section, two of the first 15 variables selected were the same for the cross validation BT's and the pilot study BT's. Total Number of 5 (New 3) Weights was the first variable selected for both the cross validation BT's and the pilot study BT's. On the justification section, five of the first 15 variables selected were the same for the cross validation BT's and the pilot study BT's. As with the two AT subsamples, Total Number of Index Terms Used was the first variable selected for both the cross validation BT's and the pilot study BT's.

The key discriminating variables for the cross validation and pilot study samples as well as for the AT and BT subsamples were Total Number of 5 (New 3) Weights and Total Number of 2 (New -1) Weights in the evaluation section. In the justification section without exception the key discriminating variable was Total Number of Index Terms Used. What are the results like for the generalization sample? Table 37 shows that these same three variables were those selected first in the stepwise discriminant analysis of the generalization sample. Total Number of 2 (New -1) Weights and Total Number of 5 (New 3) Weights were selected first and second in the evaluation section. Total Number of Index Terms Used was selected first in the justification section.

When the two occupational groups comprising the generalization sample are considered individually, the results are not quite unanimous. Neither Total Number of 5 (New 3) Weights nor Total Number of 2 (New -1) Weights was selected in the evaluation section for the generalization CS's (see Table 38). However, Total Number of Index Terms Used was the first variable selected in the justification section for the generalization CS's. In Table 39 showing the results for the generalization RM's, Total Number of 2 (New -1) Weights was selected as the first variable in the evaluation section and Total Number of 5 (New 3) Weights was selected as the fifth variable. Again, Total Number of Index Terms Used was selected first in the justification section.

Two findings are striking. *Without exception* better classification was achieved in the content analysis of the narrative comments in the justification section, and *without exception* the first variable selected in the various stepwise discriminant analyses for the justification section was Total Number of Index Terms Used. This variable reflects the variety of specific areas of a ratee's performance that the evaluator chose to comment on, and is measured by the number of different index terms selected by the indexer to encompass the narrative content. It appears that the range of skills and abilities that a chief petty officer possesses may be a key factor in his superior performance.

Another important finding is that better classification was achieved when each of the four occupational ratings studied in this research project was considered individually. In addition to Total Number of 5 (New 3) Weights, Total Number of 2 (New -1) Weights, and Total Number of Index Terms Used, a number of specific index terms among the first five selected should be called out as potential key variables in discriminating between superior chief petty officers and their slightly less qualified colleagues. For the cross validation AT's these variables were COMMUNICATION; COOPERATION; LEADERSHIP AND DIRECTING; PRODUCTIVITY AND ACHIEVEMENT; TECHNICAL SKILLS; and SKILLS AND ABILITIES. For the pilot study AT's these variables were AWARDS AND PUNISHMENT; COMMUNICATION; CONDUCT, INTEGRITY, AND PRIDE; INTELLECTUAL FUNCTIONING; and PRODUCTIVITY AND ACHIEVEMENT. The potential key variables for the cross validation BT's were CONDUCT, INTEGRITY, AND PRIDE; COOPERATION; LEADERSHIP AND DIRECTING; PRODUCTIVITY AND ACHIEVEMENT; and RESOURCEFULNESS. For the pilot study BT's these variables were AWARDS AND PUNISHMENT; LEADERSHIP AND DIRECTING; PRODUCTIVITY AND ACHIEVEMENT; PROFESSIONALISM; REPUTE; and RESPONSIVENESS. The potential key variables for the CS's were ASSET TO THE NAVY; COMMUNICATION; CONTROLLING; INITIATIVE; MANAGEMENT FUNCTIONS; PROFESSIONALISM; REPRESENTATION; and SKILLS AND ABILITIES. For the RM's these variables were AWARDS AND PUNISHMENT; COOPERATION; MANAGEMENT FUNCTIONS; POTENTIAL; and PRODUCTIVITY AND ACHIEVEMENT. These same specific index terms were also the variables achieving statistical significance beyond the .001 level of probability in the Mann-Whitney U test as well as the t test of mean difference for the comparison on the cross validation and generalization samples between the Middle and Upper criterion groups, the most difficult discrimination to be made between any two of the three criterion groups (see Tables 20 to 23).

Ten of the 29 index terms do not appear to lend as much assistance in the discrimination task as the key variables cited above. These less useful terms are the following: DRIVE; ENDURANCE; FLEXIBILITY; GROOMING AND ATTIRE; ORGANIZATION; PLANNING; RELIABILITY AND DEPENDABILITY; SERVICE MOTIVATION; STAFFING; and USE OF COMMUNICATION. However, all but two of these ten terms were selected as one of the sixth to the tenth variables in at least one of the stepwise discriminant analyses performed. The two exceptions were FLEXIBILITY and USE OF COMMUNICATION, the least useful terms used in this study. These findings suggest that a smaller number of dimensions than the full complement of 67 quantitative variables derived from the indexing procedure can be used to identify superlative CPO's whose superior performance recommends them as candidates for promotion to a higher level of responsibility.

## SECTION 5. RELIABILITY STUDY

A comprehensive reliability study was conducted whose objectives were two-fold: (1) to determine the level of agreement among several individuals all of whom independently would perform a content analysis of the same corpus of Evaluation Reports, and (2) to investigate if nonresearchers could be trained successfully to apply the complex content analysis methodology developed in the pilot study.

A set of 48 Evaluation Reports was selected by the Navy Personnel Research and Development Center, representing a cross section of the kinds of reports included in the overall experimental design for the cross validation and generalization samples. In each of these 48 Evaluation Reports the evaluation section was separated from the justification section so that the narrative comments for each section were not considered together. This resulted in a group of 96 randomized pieces of narrative text to be indexed in the reliability study. To each of these 96 pieces of narrative text was appended the corresponding sections 4A and 4B of the Evaluation Report form. These two sections provide a description of the ratee's primary and collateral duties and should be read as background information before beginning to index the narrative text. Each of these 96 *minidocuments* was assigned a 4-digit identification number by NPRDC, Xeroxed in multiple copies, and sent to R-K Research and System Design to be used as the data base in the reliability study.

Four individuals participated in the reliability study: (1) the experienced indexer who also indexed the pilot study sample, the cross validation sample, and the generalization sample; (2) the principal investigator; (3) an inexperienced indexer (inexperienced indexer A) with two years of college in the liberal arts; and (4) another inexperienced indexer (inexperienced indexer B) with executive secretary experience. To this end a training manual was prepared by the experienced indexer and the principal investigator to assist the two neophyte indexers in understanding their assignment. The training manual in its entirety is included in this report as Appendix A. The version of the training manual shown in Appendix A is not the original version that was used to train the four reliability indexers, but rather is an updated version that includes voluminous examples of how to handle difficult indexing decisions and which also attempt to eliminate areas of confusion brought to light in analyzing the results of the reliability study.

Six intensive training sessions were conducted by the experienced indexer in order to try to bring all four indexers up to a common level of expertise before beginning the actual study. Obviously, this objective could only be met partially in view of the varying educational backgrounds of the four reliability indexers and their different levels of previous exposure to the indexing dictionary. The study itself proved to be a traumatic experience for the three reliability indexers who had not spent the past year doing the actual indexing of the cross validation and generalization samples, probably because they were still in the early stages of their learning curves. The task given to each participant was extremely difficult and can be likened to a take-home, open-book final examination without a time limit. However, given the experience of participating in the study, all four of the reliability indexers now feel that they are better qualified to function as regular indexers and could perform this assignment in a consistent manner.

When all four reliability indexers had completed indexing the 96 pieces of narrative text, their indexing decisions were recorded side by side on work sheets for each segment of narrative text indexed. These work sheets provided the data base for computing agreement statistics. In all of the statistical computations reported subsequently in this section, assignment of the index terms was considered to be a separate intellectual task from assigning the corresponding weights based on the modifying adjectives and adverbs. There is good justification for analyzing the reliability study results in these two contexts. When an indexer studied a segment of narrative text, the first step was to select an appropriate index term or terms from among the 29 possibilities that best described the substantive content of the text. Once the indexer had completed this first phase of the content analysis, then the segment of narrative text was rescanned to identify the adjectives and adverbs that defined the numerical weight to be assigned to each index term chosen. Considering these judgments as two sequential decision processes also made the results of the reliability study more amenable to statistical analysis as will be shown in the subsequent discussion.

As early as 1960 Cohen, in introducing a new agreement statistic called kappa, pointed out that for most problems in nominal scale agreement between two judges or decision makers, many investigators compute a contingency chi square as a test of the hypothesis of chance agreement, and some investigators have gone on to compute the contingency coefficient,  $C$ , as a measure of degree of agreement.<sup>20</sup> However, Cohen concluded that the use of chi square ( $\chi^2$ ), and therefore, the  $C$  which is based on it for the evaluation of agreement is indefensible. When applied to a contingency table,  $\chi^2$  tests the null hypothesis with regard to *association*, not agreement. Therefore,  $\chi^2$  and  $C$  are inappropriate statistics for measuring agreement since they will be inflated quite impartially by any departure from chance association, *either disagreement or agreement*. In order to remedy this situation, Cohen suggested a new coefficient, kappa, to measure the degree of agreement in nominal scales, and to provide means for testing hypotheses and setting confidence limits for this coefficient.

Quoting from Cohen's 1960 article [20, pp. 39-40], "...for any problem in nominal scale agreement between two judges, there are only two relevant quantities:

$p_o$  = the proportion of units in which the judges agreed

$p_c$  = the proportion of units for which agreement is expected by chance.

The test of agreement comes then with regard to the  $1 - p_c$  of the units for which the hypothesis of no association would predict disagreement between the judges. This term will serve as the denominator.

"To the extent to which nonchance factors are operating in the direction of agreement,  $p_o$  will exceed  $p_c$ ; their difference,  $p_o - p_c$ , represents the proportion of the cases in which beyond-chance agreement occurred and is the numerator of the coefficient.

"The coefficient  $\kappa$  is simply the proportion of chance-expected disagreements which do not occur, or alternatively, it is the proportion of agreement *after* chance agreement is removed from consideration:

$$\kappa = \frac{p_o - p_c}{1 - p_c} ."$$

The significance of an obtained  $\kappa$  is determined by dividing  $\kappa$  by  $\sigma_{\kappa_o}$  where  $\sigma_{\kappa_o} = \sqrt{\frac{p_c}{N(1 - p_c)}}$ . The resulting critical ratio is referred to the normal curve. However, Cohen has pointed out that it is generally of as little value to test  $\kappa$  for significance as it is for any other reliability coefficient ---to know merely that  $\kappa$  is beyond chance is trivial since one usually expects much more than this in the way of reliability in psychological measurement. However, the size of the critical ratio does provide some immediate feedback concerning the magnitude of the agreement achieved beyond the level expected by chance. Probably a more useful way to interpret the significance of an obtained  $\kappa$  is in terms of the maximum value of  $\kappa$ . The theoretical upper limit of  $\kappa$  is +1.00, but this limit can only be reached if the off-diagonal (disagreement) cells in the agreement matrix are all zero. This in turn demands that the marginal probabilities for each diagonal (agreement) cell must be identical. Perfect agreement between two judges is rarely achieved, and therefore, the marginal distributions in any agreement matrix are not identical. This means that in practice the upper limit of  $\kappa$  is never +1.00 but rather some lesser value. The maximum value of  $\kappa$  is set by the marginal distributions in any particular application of the kappa agreement statistic, and it can be calculated. A comparison of the obtained  $\kappa$  with its maximum upper limit computed from the marginal distributions provides the investigator with a more useful index of how closely the agreement level that was achieved between two judges approached the maximum level of agreement that was possible.

The kappa statistic was the measure of agreement used in analyzing the index terms assigned by the four reliability indexers. For each segment of narrative text, each indexer chose a term or terms from the list of 29 possibilities, or the decision was made that no term should be used. From a careful analysis of these indexing decisions for each pair of reliability indexers, six pairwise agreement matrices were constructed. These were 30 by 30 matrices, with the 29 index terms representing 29 of the 30 nominal categories and No Index Term Used representing the 30th nominal category. The pairwise indexing decisions for each segment of narrative text analyzed across all 96 documents in the reliability study data base were tabulated into the appropriate cell of the agreement matrix for the particular pair of indexers being compared. The 30 diagonal cells of the agreement matrix denote agreement between the two indexers in assigning index terms; all of the off-diagonal elements in the matrix represent instances in which the two indexers disagreed in their selection of terms. The total number of entries in these six matrices varied slightly among the six pairwise comparisons between the four reliability indexers, but in all instances they were very large, ranging from 1,230 tallies to 1,389 tallies. Consequently, the size of the reliability study data base can be considered to be large enough to provide a stable measure of the level of agreement achieved in performing this complex intellectual task.

Table 40 shows the results of the kappa analysis of the six pairwise comparisons between the four reliability indexers in selecting index terms for

TABLE 40

RESULTS OF THE KAPPA ANALYSIS FOR THE SIX PAIRWISE COMPARISONS  
BETWEEN THE FOUR RELIABILITY INDEXERS IN SELECTING INDEX TERMS  
FOR THE ENTIRE RELIABILITY STUDY DATA BASE

Pairwise Comparisons Between Each Pair of Reliability Indexers	$\kappa$	$\sigma_{\kappa_0}$	$z^*$	$\kappa_{max}$
The experienced indexer vs. the principal investigator	.73	.0065	111.82	.90
The experienced indexer vs. inexperienced indexer A	.88	.0072	123.49	.97
The experienced indexer vs. inexperienced indexer B	.72	.0068	106.24	.90
The principal investigator vs. inexperienced indexer A	.73	.0065	111.82	.89
The principal investigator vs. inexperienced indexer B	.71	.0064	111.06	.90
Inexperienced indexer A vs. inexperienced indexer B	.78	.0068	115.56	.92

\* A  $z$  of 3.29 is significant at the .001 level of probability. Therefore, all of the  $z$  values reported in this table are extremely significant and lead to rejection of the null hypothesis that the obtained  $\kappa$  does not exceed the chance level of agreement.

the entire reliability study data base. The second column in this table shows the value of  $\kappa$ ; the third column shows the standard error of  $\kappa$ ; and the fourth column lists the normal deviate,  $z$ , obtained by dividing  $\kappa$  by its standard error. All of the  $z$  values are very large, and consequently, extremely significant, indicating that in all six comparisons the null hypothesis that the obtained  $\kappa$  does not exceed the chance level of agreement can be rejected. The last column in Table 40 provides the maximum possible value of kappa for each of the six pairwise comparisons. These values can be used as an upper limit for comparing the level of agreement actually achieved with the maximum level possible given the marginal distributions. Thus, in the first comparison between the experienced indexer and the principal investigator, the  $\kappa$  obtained was .73 compared to a possible maximum value of .90. The best agreement in selecting index terms was obtained between the experienced indexer and inexperienced indexer A, a  $\kappa$  of .88 where the maximum  $\kappa$  possible in this instance was .97. This is a heartening finding, suggesting that an individual without a research background in only six training sessions can be trained to apply

the complex content analysis methodology developed in this research project. With additional training and further experience, this individual could be expected to apply these indexing skills in an even more consistent manner.

The other values of  $\kappa$  in Table 40 are not as large as the one for the comparison between the experienced indexer and inexperienced indexer A. However, they all range between .71 and .78, with .71 probably representing the lower limit of reliability achievable in a study of this kind. With additional training in those areas where there was confusion in the minds of the reliability indexers as they wrestled with the task of selecting the most appropriate index term, the expectation would be that better agreement could be achieved among these same four individuals if they were to replicate this experiment. All four reliability indexers have expressed their concordance with this expectation.

A careful perusal of the six agreement matrices from which the statistics presented in Table 40 were derived was very instructive. Most of the off-diagonal cells were empty. When there were tallies, they were sporadic and scattered with only one or two tallies appearing in an occasional cell off the diagonal. However, two areas of confusion were prominently displayed in these six matrices. One minor area of confusion was between PRODUCTIVITY AND ACHIEVEMENT and MANAGEMENT FUNCTIONS, although this confusion could not be considered to be extensive. The revision of the training manual included in Appendix A has attempted to clarify the points of confusion between these two index terms.

The other area of confusion is major and deserves special comment. In the six training sessions it was pointed out that certain statements in the narrative text describe the job duties and the qualifications for the position that the ratee occupies rather than the ratee's actual qualifications for and performance in this position. When such a factual statement of the requirements for the position were included in the narrative text, it was *not* to be indexed since it told nothing about the ratee's qualifications and performance per se. Therefore, it was not considered to be an evaluative statement. Unambiguous examples of this type of narrative statement taken from the training material are the following:

*Example 1.* As the Quality Control Chief he is responsible for the continuous updating of a number of SOP's as well as implementing the new ones that are required.

*Example 2.* Chief XX is presently serving in an RM1 billet. This is because he made Chief Petty Officer in November 1970.

However, when confronted with indexing the reliability study data base itself, this indexing convention was frequently misconstrued by the three reliability indexers who had not had the extensive indexing experience that the experienced indexer had had. The following two examples illustrate where the confusion arose.

*Example 3.* Ratee's assignment demands particularly delicate tact, due to his working among civilians upon whom he must depend for cooperation.

The experienced indexer did not assign any index terms to this sentence, concluding that it was a statement defining the requirements of the job position rather than how the ratee performed in the job. All of the other three reliability indexers inferred that the individual evaluating the ratee was actually referring to the fact that the ratee possessed tact in interfacing with the civilian community. The principal investigator used the terms CONDUCT, INTEGRITY, AND PRIDE and REPRESENTATION to index this sentence, as did inexperienced indexer B. Inexperienced indexer A used only CONDUCT, INTEGRITY, AND PRIDE. There was substantial agreement among the three less experienced reliability indexers, but none of them matched the indexing decision of the experienced indexer that they were trying to emulate. Another example of this type of disagreement is the following:

*Example 4.* Additionally, he must supply satisfactory solutions to the many problems of the Company Commanders in connection with these services.

Again the experienced indexer considered this comment to be a statement defining the requirements of the job position whereas the other three reliability indexers attributed the skill required to the ratee. The principal investigator and inexperienced indexer B called the skill CONTROLLING; inexperienced indexer A called it PLANNING.

Disagreement in which the experienced indexer did not assign any index terms and the other three reliability indexers did assign one or more terms is very noticeable in studying the three agreement matrices in which the three less experienced reliability indexers are compared with the experienced indexer. This type of disagreement also occurred in the three comparisons among the less experienced indexers, emphasizing the general confusion that existed in how to handle statements of the type shown in Examples 3 and 4 above. Additional training aimed at clarifying this area of confusion most likely would markedly reduce this type of disagreement and raise the magnitude of  $\kappa$ .

Analysis of the level of agreement among the four reliability indexers in assigning numerical weights to each index term selected, based on the modifying adjectives and adverbs, was performed differently than the analysis of the level of agreement in selecting the index terms themselves. Selection of the index terms in this reliability study constituted a nominal scale whereas assignment of a numerical weight to each index term selected was an indexing decision involving an ordinal scale. Therefore, more powerful agreement statistics could be employed. Since numerical weights on a scale from 1 to 5 (New -2 to New 3) were assigned to each index term selected, it was possible to compute a product moment correlation coefficient between each pair of reliability indexers. The new transformed weights were used in these computations since this ordinal scale provided a more justifiable way of measuring the situation in which one indexer did not select an index term but the other indexer did (see Table 9).

In addition to computing these six product moment correlation coefficients, another agreement statistic, weighted kappa, was also calculated in order to determine if it agreed with the results of the correlational analysis. In 1968 Cohen published another article generalizing the kappa statistic to the situation in which disagreements of varying gravity can be weighted accordingly.<sup>21</sup>

Application of weighted kappa to quantifying the level of agreement in psychiatric diagnosis was also shown by Cohen and his colleagues.<sup>22</sup>

Weighted kappa is an agreement statistic corrected for chance agreement, to be used when different kinds of disagreement are to be differentially weighted in the agreement index. The desired weighting is accomplished by an a priori assignment of weights to the  $r$  by  $c$  cells of the agreement matrix, and must be done very carefully because the weights assigned are an integral part of how agreement is defined, and therefore, how it is measured with weighted kappa ( $\kappa_w$ ). Table 41 shows the weighting algorithm that was used in computing  $\kappa_w$  for assessing the level of agreement in assigning numerical weights, based on the modifying adjectives and adverbs, to the index terms selected in the reliability study. The first step in computing  $\kappa_w$  was to construct a 6 by 6 agreement matrix between each pair of reliability indexers that encompassed all of the pairwise numerical weights that were assigned to index terms based on their modifying adjectives and adverbs. These numerical weights were tabulated in the agreement matrix across all 96 documents in the reliability study data base. Using the first row of Table 41 as an example, if Reliability Indexer I and Reliability Indexer II both had assigned a numerical weight of 3 to the index term that they had selected, it represented perfect agreement in their interpretation of the superlativeness of the adjective or adverb modifying the index term. Therefore, the 3,3 cell was given an a priori weight of zero in computing  $\kappa_w$  since perfect agreement should receive no penalty. If one indexer had assigned a numerical weight of 3 to the index term selected

TABLE 41

	2	1	0	1	2	3	4
	1	2	1	0	1	2	3
	0	3	2	1	0	1	2
	-1	4	3	2	1	0	1
	-2	5	4	3	2	1	0

and the other indexer had assigned a numerical weight of 2, they only disagreed by one position on the ordinal scale, and therefore, the 3,2 cells were given an a priori weight of one in computing  $\kappa_w$ , penalizing this mild disagreement only slightly. In the extreme case, if one indexer had assigned a numerical weight of 3 to the index term selected and the other indexer had assigned a numerical weight of -2, they disagreed by five positions on the ordinal scale, and therefore, the 3,-2 cells were given an a priori weight of five in computing  $\kappa_w$ , penalizing this extreme disagreement the maximum possible. This same logic was applied in determining the weights to be used in computing  $\kappa_w$  throughout the remainder of the matrix. All of the diagonal cells were given a weight of zero since in no case should perfect agreement be penalized. All cells immediately off the diagonal were penalized by a weight of one; those cells slightly farther off the diagonal were penalized by a weight of two; and so on out to a penalty weight of five for the case of worst disagreement.

The formula for computing  $\kappa_w$  is

$$\kappa_w = 1 - \frac{\sum w_{ij} p_{oij}}{\sum w_{ij} p_{cij}}$$

where  $w_{ij}$  = a priori weight in cell  $ij$

$p_{oij}$  = observed proportion in cell  $ij$

$p_{cij}$  = chance proportion in cell  $ij$

The standard error of  $\kappa_w$  is equal to

$$\sigma_{\kappa_{w0}} = \sqrt{\frac{\sum w_{ij}^2 p_{cij} - (\sum w_{ij} p_{cij})^2}{N(\sum w_{ij} p_{cij})^2}}$$

A significance test of  $\kappa_w$ , that is, a test of  $H_0$ : Population  $\kappa_w$  - Observed  $\kappa_w = 0$ , is accomplished by evaluating the normal curve deviate

$$z = \frac{\kappa_w}{\sigma_{\kappa_{w0}}}$$

Table 42 shows the results of the correlational analysis and the weighted kappa analysis for the six pairwise comparisons between the four reliability indexers in assigning numerical weights to each index term selected, based on the modifying adjectives and adverbs, for the entire reliability study data base. The results of the correlational analysis are shown first in Table 42. The best agreement in assigning numerical weights to each index term selected was obtained between the experienced indexer and inexperienced indexer A, a correlation coefficient of .80. The best agreement in selecting index terms themselves was also achieved between this same pair of indexers (see Table 40).

TABLE 42

RESULTS OF THE CORRELATIONAL ANALYSIS AND THE WEIGHTED KAPPA ANALYSIS  
FOR THE SIX PAIRWISE COMPARISONS BETWEEN THE FOUR RELIABILITY INDEXERS  
IN ASSIGNING NUMERICAL WEIGHTS TO EACH INDEX TERM SELECTED  
FOR THE ENTIRE RELIABILITY STUDY DATA BASE

Pairwise Comparisons Between Each Pair of Reliability Indexers	Product Moment Correlation $r_{pm}^*$	Weighted Kappa	
		$\kappa_w^{**}$	$\sigma \kappa_{w0}$ *** z
The experienced indexer vs. the principal investigator	.67	.63(.73)	.0457 13.85
The experienced indexer vs. inexperienced indexer A	.80	.78(.82)	.0539 14.41
The experienced indexer vs. inexperienced indexer B	.64	.60(.68)	.0474 12.61
The principal investigator vs. inexperienced indexer A	.70	.64	.0465 13.78
The principal investigator vs. inexperienced indexer B	.64	.61	.0449 13.55
Inexperienced indexer A vs. inexperienced indexer B	.69	.66	.0494 13.32

\* A product moment correlation coefficient of .104, based on an N of 1000, is significantly different from zero at the .001 level of probability.

\*\* The values of  $\kappa_w$  shown in parentheses take into account only those instances in which both indexers selected an index term and exclude those instances in which the experienced indexer did not select an index term but the other less experienced indexer did.

\*\*\* A z of 3.29 is significant at the .001 level of probability. Therefore, all of the z values reported in this table are highly significant and lead to rejection of the null hypothesis that the obtained  $\kappa_w$  does not exceed the chance level of agreement.

These findings corroborate each other in suggesting that an individual without a research background in only six training sessions can be taught not only how to select the most appropriate index terms but also how to consistently assign weights to these terms based on the modifying adjectives and adverbs. The other correlations reported in Table 42 are lower, but none is less than .64. All six correlation coefficients are significantly different from zero well beyond the .001 level of probability.

On the weighted kappa side of Table 42 the first column shows the value of  $\kappa_w$ ; the second column shows the standard error of  $\kappa_w$ ; and the last column lists the normal deviate,  $z$ , obtained by dividing  $\kappa_w$  by its standard error. All of the  $z$  values are large, and consequently, highly significant, indicating that in all six comparisons the null hypothesis that the obtained  $\kappa$  does not exceed the chance level of agreement can be rejected. As was expected, the  $\kappa$  values are similar in magnitude to their correlation coefficient counterparts. Again, the best agreement as measured by weighted kappa was obtained between the experienced indexer and inexperienced indexer A, a  $\kappa$  of .78. The three values shown in parentheses after the first three  $\kappa$ 's listed in Table 42 were computed in order to determine the level of agreement achieved if those instances were excluded where the experienced indexer did not select an index term, and consequently, did not assign a numerical weight but the other less experienced indexer did select an index term and assigned a weight to it. This proved to be the area of major confusion in executing the reliability study as pointed out earlier in this section in discussing the results of the kappa analysis of level of agreement in selecting the index terms themselves. Instances where the experienced indexer did not assign a weight but the other indexer did form one row in the weighted kappa computational matrix. This row can be omitted from the computation, resulting in a value for  $\kappa$  that ignores this major area of confusion and takes into account only those instances where both indexers selected an index term, and consequently, assigned a weight. The gain in the value of  $\kappa_w$  is not very large for the comparison between the experienced indexer and inexperienced indexer A when  $\kappa$  was recomputed in this fashion. However, the gain was quite substantial in the other comparisons between the experienced indexer and the principal investigator and between the experienced indexer and inexperienced indexer B. This suggests that with additional training to clarify this area of confusion and with more indexing experience, the level of agreement among the four reliability indexers could possibly be raised to a value of .80 to .85 as measured by any of the three agreement statistics employed in this study. However, values in the .90's are the ultimate objective.

In conclusion, it might be of interest to point out that the initial expectation in beginning this reliability study was that it would be extremely difficult to train nonresearch-oriented individuals to consistently index the narrative sections of Evaluation Report forms using the complex content analysis methodology that had been developed in the pilot study. The surprising result is that in only six training sessions a quite respectable level of agreement was achieved. Moreover, one of the inexperienced indexers showed a higher level of agreement with the experienced indexer than the principal investigator did, and the other inexperienced indexer agreed with the experienced indexer almost as well as the principal investigator. The intuitive feeling that the reliability indexers had after completing the reliability study was that the most difficult part of learning to index consistently was over and that with additional practice and some review training sessions they could improve their indexing skill.

## SECTION 6. FUTURE AREAS OF INVESTIGATION

In the subsequent 10-month period of this research project beginning March 1, 1973 and concluding December 31, 1973, additional studies of the 225 Evaluation Reports in the pilot study sample and the 444 Evaluation Reports in the cross validation and generalization samples will be carried out in order to devise valid, short-cut methods of indexing the narrative content of these reports based on the more lengthy and complex content analysis methodology that has already been developed. The issues of trainability and reliability in indexing this type of narrative text will be studied further. The following specific tasks are being undertaken:

### A. Short-cut Indexing Methods

Efforts are in progress to develop valid, short-cut methods for indexing the narrative content of Evaluation Reports by capitalizing on the findings resulting from the various stepwise discriminant analyses that have been performed. The variables that are entered into the discriminant function at the first five to ten steps in the analysis appear to be the key variables in discriminating among the three criterion groups. These variables then form one target for study, i.e., how to extract this differentiating information from the narrative text in a simple but reliable fashion that will achieve as good or nearly as good classification accuracy as the longer, more complex indexing methodology. This approach is being used to develop optimum streamlined classification algorithms for all four ratings represented in the research data base studied thus far, i.e., AT's, BT's, CS's, and RM's.

In addition, the literature is being searched for work that may be relevant to the objective of developing valid, short-cut methods for indexing the narrative content of Evaluation Reports.

### B. Extension of the Inter-indexer Reliability Study

An extension of the reliability study is being conducted using four reliability indexers. Two of the original reliability indexers (inexperienced indexers A and B), after refresher training using the updated version of the training manual, will independently index a different set of 48 Evaluation Reports than that used in the original reliability study and their indexing decisions will be compared to the judgments of the experienced indexer. The level of agreement between each of the inexperienced indexers and the experienced indexer after a second exposure to reliability indexing will be calculated to determine if the level of agreement can be improved with additional training and experience. In addition, two new reliability indexers will be trained, and they will independently index the original set of 48 Evaluation Reports. Their indexing decisions will be compared to those of the experienced indexer to determine if the level of agreement achieved is comparable to that found in the first reliability study.

## APPENDIX A

TRAINING MANUAL FOR INDEXING THE NARRATIVE SECTIONS OF  
NAVY PERFORMANCE EVALUATIONS FOR SENIOR ENLISTED PERSONNEL

PURPOSE	96
BACKGROUND	96
RATEES AS MANAGERS	98
QUANTIFYING THE INDEX TERMS	98
SPECIAL INDEXING CONSIDERATIONS	100
REFERENCES	104
ALPHABETICAL DICTIONARY OF INDEX TERMS	109

## PURPOSE

The purpose of this manual is to train nonresearchers in the content analysis techniques developed in a personnel research study to analyze the narrative sections of Navy performance evaluations for senior enlisted personnel in pay grades E-7 (Chief Petty Officer), E-8 (Senior Chief Petty Officer), and E-9 (Master Chief Petty Officer).<sup>1</sup> The objective of this study was to provide personnel decision makers (e.g., selection boards and detailers) with a standardized way of detecting valid and discriminating indicators of on-job performance in narrative evaluation comments.

## BACKGROUND

Section 19, Evaluation Section, of Evaluation Report Form NAVPERS 1616/8\* is designed to permit the rater (evaluator) to compare the ratee with all others of his rate known to the rater on 13 specific aspects of on-job performance as well as to make an overall comparative evaluation of the ratee's performance (see Figure A-1). Ratings are made by marking the column of the rating distribution into which the rater evaluates that the ratee falls (for example, top 1% for superlative performance). Section 19R of this form provides space for the rater to write narrative evaluation comments to describe further the ratee's performance and qualifications. Section 19S of this form provides space for the rater to write narrative justification comments and is required to support any marks assigned to the top or bottom 10, 5, or 1% columns of Section 19.

Sections 19R and 19S are referred to as the narrative text of the Evaluation Report since they are the only portions of the report where the rater uses his own words to assess the on-job performance of the senior enlisted man that he is rating. Thus far the narrative evaluation and justification sections of the Evaluation Report have not been exploited systematically in making personnel decisions because narrative text tends to resist objective analysis and interpretation. However, results from a content analysis study of the narrative text<sup>1</sup> strongly suggest that there are stable differences among the performance characteristics of chief petty officers that are reflected in the narrative statements written about them by evaluators. Furthermore, these differences are both identifiable and quantifiable. The remainder of this manual presents a set of explicit and detailed guidelines for identifying, indexing or labeling, and quantifying (by means of a weighting scale) the concepts and ideas represented in the narrative text of Navy performance evaluations for senior enlisted personnel. These quantified labels have been shown to discriminate or differentiate between superior ratees and their slightly less qualified colleagues.

---

\* This form subsequently has been replaced by another form that can be scanned by an optical character reader; however, the content of the two forms is essentially the same.

## RATEES AS MANAGERS

Senior enlisted personnel in pay grades E-7/8/9 are all managers in the sense that they all are responsible for the supervision of other enlisted men whose work they direct. Therefore, the unifying focus in this manual is on the assessment of a chief petty officer (ratee) as a manager. The operations of a manager may differ from one organization or from one institutional setting to another; however, the functions of a manager are common to all. The task of the manager is one of selecting goals and designing and maintaining an environment that makes possible the performance of individuals working together in a group to attain these goals. Chief petty officers in pay grades E-7/8/9 are junior level managers, and as such, they must perform technical as well as managerial functions. Table A-1 shows a hierarchy of 29 index terms or labels that can be used to characterize the on-job managerial performance of chief petty officers. These index terms are the terms to be imposed onto the narrative text to give it objective structure and to systematize the way that this text is analyzed and interpreted. Note in Table A-1 that the 29 index terms are divided into three sections. The first section contains seven specific MANAGEMENT FUNCTIONS that many authorities on management practice agree are the characteristic duties of all managers.<sup>2,3,4,5,6</sup> Although some authorities believe that there are more, less, or different functions performed by managers, these seven functions were selected because they are representative of the duties that chief petty officers actually perform.

The second section of Table A-1 contains index terms for 13 specific SKILLS AND ABILITIES considered to be important by Navy supervisory personnel in performing effectively as a chief petty officer. While some authorities on management practice consider making a judgment about whether or not an individual possesses a skill, quality, or ability to be a subjective process, Navy evaluators do repeatedly call out these specific qualities in their narrative evaluations because many of these qualities are dimensions on which they rate the ratee in Section 19 of the Evaluation Report. The first section of Table A-1---MANAGEMENT FUNCTIONS---deals with how a ratee performs his managerial functions and is result oriented, while the second section---SKILLS AND ABILITIES---contains index terms that relate to an individual's characteristics and qualities which, if used, may help him achieve good results.

The third section of Table A-1---PRODUCTIVITY AND ACHIEVEMENT---is the most result-oriented section of the hierarchy. Here are included the measures of overall performance. DRIVE and SERVICE MOTIVATION (a specific type of drive) are included in this section since drive is considered to contribute to successful performance. POTENTIAL also is included here since potential is a measure of future performance. AWARDS AND PUNISHMENT, REPUTE, and ASSET TO THE NAVY represent acknowledgments of an individual's performance, either positive or negative acknowledgment.

## QUANTIFYING THE INDEX TERMS

It is not enough to simply label a narrative statement with the most appropriate index term since the statement may have been a highly positive, quite positive, neutral, quite negative, or highly negative one. For example,

TABLE A-1  
HIERARCHY OF INDEX TERMS

MANAGEMENT FUNCTIONS

CONTROLLING  
LEADERSHIP AND DIRECTING  
ORGANIZATION  
PLANNING  
REPRESENTATION  
STAFFING  
USE OF COMMUNICATION

SKILLS AND ABILITIES

RESOURCEFULNESS  
RESPONSIVENESS  
TECHNICAL SKILLS

PRODUCTIVITY AND ACHIEVEMENT

AWARDS AND PUNISHMENT  
DRIVE  
SERVICE MOTIVATION  
POTENTIAL  
REPUTE  
ASSET TO THE NAVY

in order to differentiate between the ratee who plans superbly and the ratee who plans inadequately, a weighting scale was devised to be applied to each index term that is used (see Table A-2). The weighting scale contains five numerical values ranging from 5, the positive end of the scale, to 1, the negative end of the scale. Under each numerical value in Table A-2 there are listed examples of adjectives or adverbs that may be used by the rater to describe a ratee's performance. These lists of words provide clues to the indexer as to which numerical value to assign to an index term. As a simple example, if the rater commented that the ratee was highly cooperative, this statement would be indexed as COOPERATION and assigned a weight of 4 since *highly* is listed as an example under numeral 4 in Table A-2.

However, in many cases the indexer will have to exercise his own judgment. Some of the words that will require such a judgment are the following: *abnormally, absolutely, all, always, consistently, constantly, fully, immeasurable, intense, no doubt, obvious, totally, unquestionably, and uppermost*. An indexer will encounter many more words than those enumerated above that will require good judgment in choosing the most appropriate weight to use. For example, consider the following statement: "He is always resourceful." This statement would be indexed as RESOURCEFULNESS 4, because the statement could have been worded in a stronger way. The rater could have said, "He is always fully resourceful." This stronger statement would have been indexed as RESOURCEFULNESS 5. The words *always* and *fully* in most cases indicate the use of a 4 on the weighting scale; yet in the above example where they appear together, the statement is made so strongly that a weight of 5 is the correct indexing decision. However, there are other 4-weighted modifiers that when used in combination still remain a 4, for example, *remarkably well* or *highly effective*, because the modifying phrase could have been worded even more strongly, for example, *extremely well* or *most effective*. It is important to remember when using the weighting scale that the indexer should ask himself, "Could this statement have been phrased in another way by the rater that would have made it a stronger or a weaker statement?" The indexing convention to be followed for the modifier *quite* is to consider it to have a positive connotation and to give it a weight of 4 as in the following example: "He has been quite resourceful in making do with available parts." RESOURCEFULNESS 4. However, there may be instances in which the indexer would assign a 2 weight to the modifier *quite* if the context was sufficiently negative to warrant it as in the following example: "His tendency to be quite overweight detracts from his overall appearance." GROOMING AND ATTIRE 2. Note that AWARDS AND PUNISHMENT is given either a 5 or a 1 weight since there is no degree of variance. Either the ratee was given an award or not, or was punished (disciplined) or not.

#### SPECIAL INDEXING CONSIDERATIONS

An alphabetical dictionary of the 29 index terms appears at the end of this discussion. For each term in the dictionary, a definition is given, examples of narrative text indexed with the term are cited, and usage rules to guide the indexer in choosing this term or another term are supplied. Careful study of the dictionary will instruct the new indexer in how index terms and their numerical weights should be assigned in order to ensure a systematic and objective application of the indexing procedures explained in this manual.

NOTE: AWARDS AND PUNISHMENT is assigned a weight of either 5 or 1.

Although some indexing examples may not always seem logical to the new indexer, each indexing decision has been meticulously and thoroughly considered. The examples presented in the alphabetic dictionary represent a distillation of two years' of indexing experience and constitute a self-instructional compilation of crucial indexing rules and conventions that the new indexer needs to know in depth in order to be able to index the narrative text of Evaluation Reports accurately and consistently.

There are several indexing considerations that should be kept in mind as they will assist the indexer in maintaining consistency and will help resolve indexing dilemmas. Sections 4A and 4B of Evaluation Report Form NAVPERS 1616/8 provide a description of the ratee's primary and collateral duties. These sections should be read as background information before beginning to index the narrative text. An example of these two sections is shown below:

4A. DESCRIPTION OF PRIMARY DUTIES DURING THIS REPORTING PERIOD

Ratee is assigned as supervisor of Intermediate Level Maintenance on communications, navigation, and radar systems installed in the EA-3B, EP-3B, and EC-121M aircraft.

4B. DESCRIPTION OF COLLATERAL DUTIES AND/OR SPECIAL ASSIGNMENTS DURING THIS REPORTING PERIOD

Ratee is assigned on a rotational basis as the Avionics Supervisor at the squadron detachment in Danang, RVN. He also stands Assistant Squadron Duty Officer watches.

Information about a ratee's job duties is needed when indexing because a statement about an individual's achievement may not be in terms of performing a managerial function but rather in terms of his overall performance. Consider the following statement from the narrative text: "Ratee's supervision of maintenance of the communication and radar systems has been outstanding." This statement would be indexed as PRODUCTIVITY AND ACHIEVEMENT 5 because it is an assessment of the ratee's overall job performance as a supervisor of intermediate-level maintenance rather than performance of the controlling function of maintaining equipment in order to assure accomplishment of plans.

Another consideration to keep in mind is that when a description of a job or job duties is included in the narrative text, this description is not indexed since it is a factual statement describing the qualifications needed to perform a specific job or the duties of that job. Therefore, the statement is about the job itself and not about the ratee. Even if such a statement is modified by adjectives or adverbs, it still is not indexed if it refers to how a job should be performed and not to how the ratee actually performs a job. As an illustration of this convention, if planning is mentioned as one of the ratee's duties, this is a factual statement since it is the duty of all managers to plan and no index term would be assigned to this statement. For example, "Chief XX is required to develop procedural methods of accomplishing the division workload." Even if an adjective or adverb is added to this statement--- "Chief XX is required to develop effective and efficient procedural methods of accomplishing the division workload," the statement is still about a specific

job duty or requirement and the modifiers refer to how the job should be performed. The modifiers do not refer to the ratee per se and, therefore, this statement should not be indexed since it is not evaluating the ratee. However, if a statement is a qualitative statement and refers to the ratee, then it becomes a statement of evaluation and is indexed. If the rater said that the ratee plans well on the job, then a value judgment has been rendered about what kind of a planner the ratee is. For example, "Chief XX has developed effective and efficient procedural methods of accomplishing the division workload"; this statement would be labeled PLANNING 4. The statement no longer is a factual one but has become an evaluative comment about the ratee rather than a statement describing a job requirement. "Chief XX has developed procedural methods of accomplishing the division workload," would be labeled PLANNING 3 since the rater thought it worthwhile to mention this information and the statement, therefore, evaluates the ratee although no modifying adjective or adverb was used. *Always keep in mind that indexing decisions are made in terms of the qualifications that a ratee actually possesses that can aid him in performing a job, in terms of how a job is performed by a ratee, or in terms of the results achieved.*

Also keep in mind that in deciding on which numerical weight to use, modifying adjectives and/or adverbs must be associated with the idea or concept being indexed and not with another idea or concept in the same sentence. For example, consider the following statement: "His resourcefulness in completing his tasks in the most efficient and thorough manner is noted." *Most* is associated with the manner in which the ratee performs his tasks and, therefore, qualifies PRODUCTIVITY AND ACHIEVEMENT as a 5. The ratee's resourcefulness is not modified but it is stated that he possesses that characteristic. It helped to make the 5 weight possible for PRODUCTIVITY AND ACHIEVEMENT, but the first part of the statement is only indexed as RESOURCEFULNESS 3. To be given a 5 weight, the statement would have had to have been, "His outstanding resourcefulness in completing his tasks in the most efficient and thorough manner is noted." When there is no modifier given for an evaluative statement, a 3 weight is assigned to the index term selected (e.g., "His planning efforts have led to..." would be labeled PLANNING 3). Also, if a modifying adjective or adverb that falls at the 3 position on the weighting scale is included in the evaluative statement, the index term selected still would be given a weight of 3 (e.g., "His competent planning has led to..." would also be labeled PLANNING 3). Each statement indexed has to be regarded as a separate entity lest confusion and inconsistency result. *Always remember the rule: How else could this statement have been worded?*

However, if an adjective occurs before a string of words and phrases, this adjective modifies each word or phrase in the string until there is a clear break in the sentence structure, or until the adjective could not logically and/or grammatically be associated with a particular word or phrase. For example, "His outstanding technical knowledge and organizational ability have contributed to..." would be indexed as TECHNICAL SKILLS 5 and ORGANIZATION 5. The adjective *outstanding* modifies both phrases. Note that organization in the above example is referred to as a skill; yet it is placed under MANAGEMENT FUNCTIONS in the hierarchy of index terms. It is often difficult to differentiate between the performance of a function and the function as an actual skill that an individual may have. For example, there is a definite

ability to lead or skill of leadership; yet it also is a very important function performed by managers. These subtleties in word meaning and usage are part of the expressive fabric of the English language and continue to plague those who strive to achieve precision in systematizing the information content of written discourse. At some point arbitrary rules have to be imposed. In this content analysis scheme, both organization and leadership are considered to be principally management functions rather than skills an individual may possess.

It is also important to remember when indexing and applying the weighting scale to be careful to take note of the words that are actually contained in the definition of an index term. Consider the definition of COMMUNICATION: COMMUNICATION refers to the expression of thoughts and feelings through the spoken or written word in a clear and concise manner. Therefore, the indexer should regard the ability to communicate in a clear and concise manner as an average ability and index any statement phrased similarly as COMMUNICATION 3. If a ratee is said to communicate in a very concise manner, then this statement would be indexed as COMMUNICATION 4.

Every attempt has been made to present the information contained in this manual in as explicit and lucid a form as possible. However, indexing remains more of an art than a science for all of the reasons alluded to previously. As an indexer you will encounter segments of narrative text for which only your considered judgment can help you arrive at the final decision. It is important, though, that you try to keep your judgments as consistent as possible. The best way to assure consistency is to keep records of difficult or marginal decisions and, if possible, of the basis on which these decisions were made. Table A-3 presents a glossary of indexing decisions that were made by one experienced indexer to handle the appearance of ambiguous or troublesome words and phrases in narrative text. Use this table as an extra indexing guide.

It is recommended that the new indexer become thoroughly familiar with this training manual before attempting to index the narrative sections of Evaluation Reports. If he can compare his independent trial indexing decisions with those of an experienced indexer, this procedure will serve to pinpoint areas of confusion in his understanding of the indexing rules and conventions. Frequent rereading of the manual will help to guarantee that the rules are applied the same way from day to day.

## GLOSSARY OF WORD CLUES TO THE USE OF INDEX TERMS

Acts with ease = CONDUCT, INTEGRITY, AND PRIDE  
 Aggressive = DRIVE  
 Agreeable = COOPERATION  
 Alert = INTELLECTUAL FUNCTIONING (See Also RESPONSIVENESS)  
 Amiable/Affable = COOPERATION  
 Appraisal (assessment) of personnel = STAFFING  
 Background in rate = TECHNICAL SKILLS  
 Bearing = CONDUCT, INTEGRITY, AND PRIDE  
 Can-do attitude = DRIVE  
 Common sense = INTELLECTUAL FUNCTIONING  
 Congenial = COOPERATION  
 Constant = RELIABILITY AND DEPENDABILITY  
 Coordinate = ORGANIZATION  
 Decisiveness = SKILLS AND ABILITIES\*  
 Delegate = ORGANIZATION  
 Deliberate = SKILLS AND ABILITIES\*  
 Demeanor = CONDUCT, INTEGRITY, AND PRIDE  
 Deportment = CONDUCT, INTEGRITY, AND PRIDE  
 Devoted (dedicated) to duty or the Navy = SERVICE MOTIVATION  
 Devotes (dedicates) long hours = DRIVE  
 Diligent = DRIVE  
 Disposition = CONDUCT, INTEGRITY, AND PRIDE  
 Dynamic = DRIVE  
 (his) endeavor = DRIVE  
 Expediently = RESPONSIVENESS  
 Expeditious = RESPONSIVENESS  
 Expertise = TECHNICAL SKILLS  
 Forceful = DRIVE  
 Forcefulness of expression = COMMUNICATION  
 Foresight = SKILLS AND ABILITIES  
 Friendly = CONDUCT, INTEGRITY, AND PRIDE  
 Genial = CONDUCT, INTEGRITY, AND PRIDE  
 Humor = CONDUCT, INTEGRITY, AND PRIDE  
 Imagination = RESOURCEFULNESS  
 Ingenuity = RESOURCEFULNESS  
 Innovative = RESOURCEFULNESS  
 (has) instituted = INITIATIVE  
 Inventory = PLANNING + CONTROLLING  
 Judgment = INTELLECTUAL FUNCTIONING  
 Logical (keen) mind = INTELLECTUAL FUNCTIONING  
 Mature = RELIABILITY AND DEPENDABILITY  
 New ideas = INITIATIVE

\* If ratee is decisive (deliberate) in his thinking, index as SKILLS AND ABILITIES. If ratee is decisive (deliberate) in his behavior, index as CONDUCT, INTEGRITY, AND PRIDE.

TABLE A-3 (CONT.)

## GLOSSARY OF WORD CLUES TO THE USE OF INDEX TERMS

Original thinking = INITIATIVE  
Perseverance = ENDURANCE  
Recommended changes = INITIATIVE  
Sincere = CONDUCT, INTEGRITY, AND PRIDE  
Stable = RELIABILITY AND DEPENDABILITY  
Suggestion making = INITIATIVE  
Supervising men = LEADERSHIP AND DIRECTING  
Supervising tasks = MANAGEMENT FUNCTIONS  
Tactful (used alone) = CONDUCT, INTEGRITY, AND PRIDE  
Tactful with men or subordinates = LEADERSHIP AND DIRECTING  
Talent = SKILLS AND ABILITIES  
Traffic flow pattern = PLANNING + CONTROLLING  
Versatile = SKILLS AND ABILITIES  
Vigor = DRIVE  
Zeal = DRIVE

## ALPHABETICAL DICTIONARY OF INDEX TERMS

*Format:* The name of each index term is shown in all capital letters at the beginning of the definition of the term. The definition is followed by a SEE ALSO entry if there is one. The last section of the format presents a number of examples of how each term in the dictionary was used. The number following each index term is the weight assigned to it by the indexer. Additional indexing clues may also be given.

ASSET TO THE NAVY refers to the worth or value of having an individual continue his career in the Navy.

EXAMPLES:

Ratee has been an exceptionally fine asset to this command.	ASSET TO THE NAVY 5
---	---------------------

He has been a great asset to DESCOL and the Navy.	ASSET TO THE NAVY 4
---	---------------------

Ratee has proven to be a definite asset with his outstanding professional and instructional ability in a relatively short time.	ASSET TO THE NAVY 4 PROFESSIONALISM 5 COMMUNICATION 5
---	---

He is an asset to the ship and the naval service.	ASSET TO THE NAVY 3
---	---------------------

Additional Indexing Clues:

One of the most outstanding men in the Navy today.	ASSET TO THE NAVY 5
--	---------------------

He is an outstanding military man.	ASSET TO THE NAVY 5
------------------------------------	---------------------

Valuable asset to the service	ASSET TO THE NAVY 4
-------------------------------	---------------------

Great value to the U.S. Navy	ASSET TO THE NAVY 4
------------------------------	---------------------

Asset to this command	ASSET TO THE NAVY 3
-----------------------	---------------------

Valuable to any command	ASSET TO THE NAVY 3
-------------------------	---------------------

Credit to the Navy	ASSET TO THE NAVY 3
--------------------	---------------------

Credit to the squadron	ASSET TO THE NAVY 3
------------------------	---------------------

Asset to the command of the Navy	ASSET TO THE NAVY 3
----------------------------------	---------------------

ASSET TO THE NAVY is to be used only when the individual himself is considered to be an asset and not one of his traits. If one of his traits is an asset to the Navy, use asset as a qualifier for the trait. However, if his trait is an asset in performing a specific function, asset then qualifies the index term assigned to the function. For example, "His cooperative nature is a great asset to the Navy." COOPERATION 4. However, "His cooperative nature is a great asset in the performance of his coordinating responsibilities with Facilities Control and the Receiver Site," would be indexed as COOPERATION 3; ORGANIZATION 4.

AWARDS AND PUNISHMENT are measurements of an individual's job performance as reflected in his receiving official commendatory recognition or penalty, or his being recommended for such an award or penalty.

EXAMPLES:

BTC was recommended for an achievement medal for his leadership efforts during the 1969 WESTPAC Cruise.

AWARDS AND PUNISHMENT 5

Awarded the Navy Commendation Medal for meritorious service while attached to Fighter Squadron ONE FIVE ONE embarked in USS CORAL SEA (CVA-43) during combat operations from 10 October 1968 to 30 March 1969.

AWARDS AND PUNISHMENT 5

He was awarded an oral admonition.

AWARDS AND PUNISHMENT 1

Additional Indexing Clues:

Reported in a commendatory way

AWARDS AND PUNISHMENT 5

Relieved of duties

AWARDS AND PUNISHMENT 1

Use AWARDS AND PUNISHMENT only once no matter how many awards a ratee received if they are all mentioned in one statement. For example, "He won five awards for outstanding performances last year," would be indexed as AWARDS AND PUNISHMENT 5.

Use this term even if the award is given to a ratee's squadron, command, or other such unit. For example, "He contributed directly to the annual OP-EVAL award of 'Outstanding' given this division by the DCA Inspection Team during their recent visit to this Command." AWARDS AND PUNISHMENT 5.

Do not index that part of the sentence following the award statement which tells about the performance for which the ratee won the award. This is all considered to be part of the award statement. For example, "Ratee was recommended for and received the Navy Achievement Medal for his outstanding professional performance during this reporting period," would be indexed simply as AWARDS AND PUNISHMENT 5.

NOTE: AWARDS AND PUNISHMENT is assigned a weight of either 5 or 1.

COMMUNICATION refers to the expression of thoughts and feelings through the spoken or written word in a clear and concise manner. Includes *public speaking, reports, records, and letters.*

The ability to communicate is reflected in the choice of words or vocabulary, the organization of the expressed thoughts, phrasing, sentence structure, paragraphing, and overall clarity and forcefulness of expression.

SEE ALSO: USE OF COMMUNICATION

EXAMPLES:

His use of the English language is excellent and he expresses himself exceptionally well, both orally and in writing.	COMMUNICATION 5
	COMMUNICATION 5

Ratee's ability to correctly speak the English language is outstanding.	COMMUNICATION 5
---	-----------------

He utilizes a well-rounded vocabulary to very effectively express himself.	COMMUNICATION 4
--	-----------------

He possesses an average command of the English language both orally and in writing.	COMMUNICATION 3
---	-----------------

He is capable of expressing himself clearly and adequately.	COMMUNICATION 3
---	-----------------

He is soft spoken but speaks well; however, his written work, particularly spelling, could use improvement.	COMMUNICATION 4
	COMMUNICATION 2

Additional Indexing Clues:

Excellent knowledge of English language	COMMUNICATION 5
Command of language superb	COMMUNICATION 5
Grammar excellent	COMMUNICATION 5
Vocabulary excellent	COMMUNICATION 5
His reports are accurate.	COMMUNICATION 4
Expresses well in writing	COMMUNICATION 4
Expresses well orally	COMMUNICATION 4
Expresses well orally and in writing	COMMUNICATION 4
Speaks with ease	COMMUNICATION 4

## COMMUNICATION (Continued)

Can converse easily	COMMUNICATION 4
Eloquent speaker	COMMUNICATION 4
Relaxed group speaker	COMMUNICATION 3
Is at ease when speaking	COMMUNICATION 3
Presents matter in a comprehensive and interesting manner	COMMUNICATION 3
Speaks correctly	COMMUNICATION 3
Speaks logically	COMMUNICATION 3
Verbal expression is comprehensive	COMMUNICATION 3
Capable in expressing himself	COMMUNICATION 3
Difficulty speaking to large groups	COMMUNICATION 2

A ratee's ability to communicate may be expressed by the evaluator with one or more descriptive phrases, but this part of the sentence should be treated as a single entity and labeled only once with COMMUNICATION. For example, "He utilizes a well-rounded vocabulary to very effectively express himself." COMMUNICATION 4.

*Instructor* would be indexed with COMMUNICATION unless it was the ratee's job title or main job duty. In this case it most likely would be labeled MANAGEMENT FUNCTIONS or PRODUCTIVITY AND ACHIEVEMENT, depending upon the statement.

CONDUCT, INTEGRITY, AND PRIDE refers to the way that one acts and to the mental activities and attitudes that influence behavior, such as integrity and pride. Integrity refers to one's moral principles, honesty, and sincerity. Pride is the sense of one's own dignity or worth.

For the assessment of integrity we would look at an individual's use of time and expense reports, dealings with others, probity in handling assignments, sincerity about his work, and his attitude toward life.

EXAMPLES:

His conduct and personal appearance are always superb.	CONDUCT, INTEGRITY, AND PRIDE 5 GROOMING AND ATTIRE 5
--	--

He maintains an exemplary military appearance, and has high moral standards and sound sense of values.	GROOMING AND ATTIRE 4 CONDUCT, INTEGRITY, AND PRIDE 4 CONDUCT, INTEGRITY, AND PRIDE 4
--	---

Ratee reflects pride in his position as a Chief Petty Officer and provides an outstanding example through his exceptionally fine personal habits and dress under all circumstances.	CONDUCT, INTEGRITY, AND PRIDE 3 CONDUCT, INTEGRITY, AND PRIDE 5 GROOMING AND ATTIRE 5
---	---

His even disposition has proven an asset in maintaining an open channel of communication between instructor and student.	CONDUCT, INTEGRITY, AND PRIDE 3 USE OF COMMUNICATION 3
--	---

The ratee has the potential to become an outstanding chief but has problems controlling his drinking while on the bench, resulting in tardiness at the expiration of liberty and his absence during working hours.	POTENTIAL 5 CONDUCT, INTEGRITY, AND PRIDE 2 CONDUCT, INTEGRITY, AND PRIDE 2 CONDUCT, INTEGRITY, AND PRIDE 2
--	--

Excesses in alcohol have led to tardiness and a question of his dependability.	CONDUCT, INTEGRITY, AND PRIDE 1 CONDUCT, INTEGRITY, AND PRIDE 2 RELIABILITY AND DEPENDABILITY 2
--	---

Additional Indexing Clues:

He provides an excellent example for his men.	CONDUCT, INTEGRITY, AND PRIDE 5
---	---------------------------------

Chief XX's conduct is never questioned.	CONDUCT, INTEGRITY, AND PRIDE 5
---	---------------------------------

Exemplary behavior	CONDUCT, INTEGRITY, AND PRIDE 4
--------------------	---------------------------------

## CONDUCT, INTEGRITY, AND PRIDE (Continued)

Professional behavior	CONDUCT, INTEGRITY, AND PRIDE 4 PROFESSIONALISM 3
He is always correct and proper in all relationships.	CONDUCT, INTEGRITY, AND PRIDE 4 CONDUCT, INTEGRITY, AND PRIDE 4
Quick humor	CONDUCT, INTEGRITY, AND PRIDE 4
Gentlemanly	CONDUCT, INTEGRITY, AND PRIDE 3
At ease with superiors and subordinates	CONDUCT, INTEGRITY, AND PRIDE 3
Tactful	CONDUCT, INTEGRITY, AND PRIDE 3
Friendly	CONDUCT, INTEGRITY, AND PRIDE 3
Not afraid to offer criticism	CONDUCT, INTEGRITY, AND PRIDE 3
Bordered on insubordination	CONDUCT, INTEGRITY, AND PRIDE 2

It is important to remember that no matter how positive a trait may be, it is impossible to be consistent in weighting these traits; therefore, the weight is determined by the adjective which further qualifies the type of trait that a ratee possesses. For example, cheerful or cheerful personality would be given a weight of 3, while very cheerful or a very cheerful personality would be given a weight of 4.

Also included in this term are personality traits and attitudes. The following in their present form would all be indexed as CONDUCT, INTEGRITY, AND PRIDE 3: optimistic attitude; pleasant attitude; takes pride in himself; pride in his performance; dignified; self-confident; upright; honest; sincere; does not procrastinate; spends not excessive time "visiting"; perfectionist; quiet; unselfish; firm; courage; composed; calm; courtesy; disposition; obedience; loyalty to his superiors; friendly.

Good humor and a good example for contemporaries both would be indexed as CONDUCT, INTEGRITY, AND PRIDE 4 because of the word *good*.

The word *pride* often appears in the narrative text in conjunction with the way that a ratee feels about the Navy. Under these circumstances, use the index term SERVICE MOTIVATION.

CONTROLLING is the measurement of performance against established standards, correcting deviations, and assuring accomplishment of plans. In simple terms, controlling makes certain that what is done is what is intended. *Forward-looking* control prevents deviations from occurring by anticipating that they will occur unless action is taken now, such as maintenance of equipment.

Any activity which involves feedback is a controlling function in that it helps to ensure the successful accomplishment of goals (e.g., checks and balances, bookkeeping, accounting systems, traffic flow, and inventory).

EXAMPLES:

His ability to seek out potential problems and correct them before failure occurred has been extremely beneficial.

CONTROLLING 5

He is consistently capable of resolving problem areas before a critical situation can develop.

CONTROLLING 4

In his capacity as water chief tender he has enforced a strict and professional water chemistry program.

CONTROLLING 4

His analysis of divisional problems, both functional and administrative, and the execution of corrective measures have been very conducive to a smooth and highly effective division.

PLANNING 3  
CONTROLLING 3  
PRODUCTIVITY AND ACHIEVEMENT 4

Because he never examined the fireroom equipment during the 10 days in port, the unsatisfactory condition of the boilers went unchecked.

CONTROLLING 1

Additional Indexing Clues:

Prevents problems

CONTROLLING 3

Corrects difficulties

CONTROLLING 3

Overcomes obstacles

CONTROLLING 3

Maintenance is a controlling function because it helps to assure accomplishment of plans. However, if an individual's job title or main job duty is maintenance, then this usually would be indexed as PRODUCTIVITY

## CONTROLLING (Continued)

AND ACHIEVEMENT since maintenance is the performance of his total job function.

If the correction, problem solving, or prevention is of a technical nature and is performed solely by the ratee instead of by a group of his subordinates, it should be regarded more as a technical function or the demonstration of a technical skill rather than considered to be a controlling function, and would be labeled TECHNICAL SKILLS. For example, "Ratee's knowledge of the P-3 aircraft electronic systems and his ability to expeditiously correct the most complex electronic problem is outstanding." TECHNICAL SKILLS 5; RESPONSIVENESS 3; TECHNICAL SKILLS 5. The modifying adverb *outstanding* belongs to both phrases of this sentence.

The words *assure* and *ensure* should serve as a clue that the phrase which follows probably will be indexed as a controlling function.

COOPERATION is acting or working together with others or another for a common purpose. Includes *congenial*, *amiable*, or *agreeable* attitudes which enhance the act of working together.

EXAMPLES:

He always cooperates fully with his seniors and accomplishes his duties in an outstanding manner.	COOPERATION 5 PRODUCTIVITY AND ACHIEVEMENT 5
He is always willing to help others in any way he can.	COOPERATION 5
Ratee exemplifies the perfect officer-chief relationship.	COOPERATION 5
Ratee is very cooperative with his seniors and his contemporaries, always putting the interests of the Navy first.	COOPERATION 4 SERVICE MOTIVATION 5
He is cooperative and well liked.	COOPERATION 3 REPUTE 4
He is a pleasure to work with.	COOPERATION 3
He will nevertheless listen to the ideas, beliefs, and suggestions of others.	COOPERATION 3

Additional Indexing Clues:

Never hesitates to fully cooperate	COOPERATION 5
Works well with superiors and subordinates	COOPERATION 4
Gets along well with others	COOPERATION 4
Continuous cooperation in all aspects	COOPERATION 4
Complete cooperation	COOPERATION 4
Congenial	COOPERATION 3
Amiable	COOPERATION 3
Cooperative	COOPERATION 3
He will compromise.	COOPERATION 3
Cooperative with superiors and subordinates	COOPERATION 3
Assists others	COOPERATION 3
Uncooperative	COOPERATION 2

Usually a ratee's interpersonal relationship with his subordinates would be indexed as LEADERSHIP AND DIRECTING. However, when a statement has to do with a ratee's cooperative attitude in working with others, whether superiors or subordinates, then it should be labeled COOPERATION.

DRIVE is the desire or personal motivation to achieve a purpose. Includes the desire for self-improvement or the desire to manage, achieve a purpose, and improve output through the teamed effort of subordinates. Includes *conscientious, energetic, enthusiasm, forceful, and interest.*

EXAMPLES:

He is an exceptionally dedicated and hard working Chief, readily accepting and expeditiously solving problems.

DRIVE 5  
DRIVE 5  
RELIABILITY AND DEPENDABILITY 4  
CONTROLLING 4

Always works to his fullest potential.

DRIVE 5

This highly energetic and enthusiastic young petty officer has performed all aspects of his duties in an outstanding fashion.

DRIVE 4  
DRIVE 4  
PRODUCTIVITY AND ACHIEVEMENT 5

Ratee performs with vigor.

DRIVE 3

He is conscientious and is always extremely dependable.

DRIVE 3  
RELIABILITY AND DEPENDABILITY 5

Although the tasks assigned to the personnel under his supervision are always completed efficiently and in an excellent to outstanding manner, his superiors feel that he is capable of getting more out of his men and of putting more of himself into the job.

PRODUCTIVITY AND ACHIEVEMENT 5  
LEADERSHIP AND DIRECTING 2  
DRIVE 2

Ratee is not as aggressive as he could be which subsequently detracts from him reaching his full potential.

DRIVE 2  
POTENTIAL 2

Additional Indexing Clues:

He continually strives for perfection.

DRIVE 5

Always driving to do the best job possible

DRIVE 5

Completely dedicated

DRIVE 4

Attempts to achieve perfection

DRIVE 4

Volunteers for jobs

DRIVE 3

## DRIVE (Continued)

The following words and phrases would be indexed as DRIVE 4: unflagging effort; works very hard at his job; spends many extra hours at his job; dedicates or devotes long hours; tireless; chief is tireless in his efforts to improve his equipment, personnel, and records; always willing to work long hours whenever necessary; continuously strives; taking courses in off-duty hours.

The following words and phrases would be indexed as DRIVE 3: intent on doing job well; determined; works hard; applied himself; strives for improvement; drive; working long hours; aggressive pursuit of duties; can-do spirit or attitude; diligent; dynamic; ambitious; zeal; endeavor.

When a statement about drive is part of how a ratee is performing a specific function or skill, then the statement is used as a qualifier for that function or skill. For example, "Ratee works very hard at motivating his men to improve their performance," would be indexed as LEADERSHIP AND DIRECTING 4, and DRIVE would not be used. However, a statement such as, "Ratee is constantly seeking to improve the productivity of the work center," would be indexed as DRIVE 4 since there is no indication that this objective has been achieved and there is no mention of any specific function or skill.

ENDURANCE is the ability to complete tasks under conditions of fatigue, distress, stress, and/or pain.

EXAMPLES:

His endurance is outstanding.

ENDURANCE 5

During the previous deployment he demonstrated his ability to function smoothly and effectively under adverse and demanding conditions for extended periods.

ENDURANCE 4

His ability to maintain an inner calm and to function efficiently during periods of great confusion and stress suit him ideally to his present assignment.

CONDUCT, INTEGRITY, AND PRIDE 3  
ENDURANCE 4

He uncomplainingly responds when called upon to meet unscheduled commitments, frequently under adverse conditions.

RESPONSIVENESS 4  
ENDURANCE 3

Additional Indexing Clues:

Performs well under stress

ENDURANCE 4

His persistence (tenacity) in the face of adversity

ENDURANCE 3

Fortitude

ENDURANCE 3

Indefatigable

ENDURANCE 3

Tested and proven under hostile fire

ENDURANCE 3

Perseverance

ENDURANCE 3

FLEXIBILITY is the quality of being adjustable or adaptable to change; capable of modification.

EXAMPLES:

His keen mind is alert to all possible circumstances, and he succeeds brilliantly in adjusting to new environments.

INTELLECTUAL FUNCTIONING 4  
FLEXIBILITY 5

Overall, he is a highly adaptable individual who exhibits unlimited potential and continuing high value to the U.S. Navy.

FLEXIBILITY 4  
POTENTIAL 5  
ASSET TO THE NAVY 4

He is a mature, stable Chief Petty Officer, intelligent, adaptable, and reliable.

RELIABILITY AND DEPENDABILITY 3  
RELIABILITY AND DEPENDABILITY 3  
INTELLECTUAL FUNCTIONING 3  
FLEXIBILITY 3  
RELIABILITY AND DEPENDABILITY 3

Additional Indexing Clues:

Adjusts quickly

FLEXIBILITY 4

Able to handle varied jobs and hence is a very valuable Chief

FLEXIBILITY 3  
ASSET TO THE NAVY 4

Flexible

FLEXIBILITY 3

Open minded

FLEXIBILITY 3

Open mind to criticism

FLEXIBILITY 3

GROOMING AND ATTIRE is the way in which a person cares for his physical appearance and clothing.

EXAMPLES:

Neat and polished appearance is in keeping with the highest Navy standards and serves as a criteria of excellence among the men with whom he comes in contact.

GROOMING AND ATTIRE 5

Ratee's personal appearance is always correct and proper.

GROOMING AND ATTIRE 4

He is always neat in appearance and his conduct is exemplary.

GROOMING AND ATTIRE 4  
CONDUCT, INTEGRITY, AND PRIDE 4

He is tidy, intelligent, and obtains the best results from his men.

GROOMING AND ATTIRE 3  
INTELLECTUAL FUNCTIONING 3  
LEADERSHIP AND DIRECTING 5

His tendency towards being overweight greatly detracts from his overall appearance.

GROOMING AND ATTIRE 2

Additional Indexing Clues:

His impeccable appearance leaves nothing to be desired.

GROOMING AND ATTIRE 5

Wearing of uniform excellent

GROOMING AND ATTIRE 5

Always impeccable

GROOMING AND ATTIRE 4

His appearance is immaculate at all times.

GROOMING AND ATTIRE 4

His appearance and dress is always correct, smart, and impressive.

GROOMING AND ATTIRE 4

His uniform is consistently immaculate.

GROOMING AND ATTIRE 4

His appearance is good and sets an example for all.

GROOMING AND ATTIRE 4

His dress is impressive, and is worn with care.

GROOMING AND ATTIRE 4

Uniform (or dress) immaculate

GROOMING AND ATTIRE 4

Grooming impeccable

GROOMING AND ATTIRE 4

He takes pride in his appearance.

GROOMING AND ATTIRE 3

Attention to his appearance

GROOMING AND ATTIRE 3

Appearance military

GROOMING AND ATTIRE 3

Shined shoes

GROOMING AND ATTIRE 3

INITIATIVE is the ability to recognize and originate necessary or appropriate tasks on one's own without being asked.

EXAMPLES:

His personal appearance, cooperative attitude, and initiative leave virtually nothing to be desired.	GROOMING AND ATTIRE 5 COOPERATION 5 INITIATIVE 5
He is extremely reliable and never fails to take the initiative in difficult situations.	RELIABILITY AND DEPENDABILITY 5 INITIATIVE 5
He displays an outstanding example in initiative.	INITIATIVE 5
Ratee displays considerable initiative in accomplishing each task assigned.	INITIATIVE 4
Ratee possesses a keen mind, is capable of original thinking, and expresses his thoughts well and decisively when communicating with others.	INTELLECTUAL FUNCTIONING 3 INITIATIVE 3 COMMUNICATION 4
Ratee is proficient in anticipating situations in his area of responsibility and initiates action to cope with it.	CONTROLLING 4 INITIATIVE 3
Ratee undertakes his duties willingly but lacks the initiative that is required of the very best in his rate.	RELIABILITY AND DEPENDABILITY 4 INITIATIVE 2
However, at times he lacks the initiative and drive that is necessary to produce these results.	INITIATIVE 2 DRIVE 2

Additional Indexing Clues:

Provided Division officer with many ideas	INITIATIVE 4
Volunteering his own views	INITIATIVE 3
Making suggestions (recommendations)	INITIATIVE 3
An original thinker	INITIATIVE 3
Institutes	INITIATIVE 3

"He has shown initiative by repairing the probe refueling hose and fixing the main feed pumps in the forward fireroom." INITIATIVE 3; PRODUCTIVITY AND ACHIEVEMENT 3. Here the index term PRODUCTIVITY AND ACHIEVEMENT is used rather than TECHNICAL SKILLS because the indexer cannot be certain whether the ratee had the skill to do this himself or whether he actually managed or directed others to accomplish this task. CONTROLLING is not used here because the ratee's main job duty was maintenance.

INTELLECTUAL FUNCTIONING is the ability to learn or understand from experience, and the ability to analyze, reason, and perceive relationships and differences.

A measurement of intellectual functioning would be a scholastic record.

EXAMPLES:

He completed all courses with very high grades, usually leading his class.

INTELLECTUAL FUNCTIONING 5

Ratee is extremely intelligent.

INTELLECTUAL FUNCTIONING 5

He learns quickly and applies his training and experience effectively.

INTELLECTUAL FUNCTIONING 4  
PRODUCTIVITY AND ACHIEVEMENT 4

He is a forceful and intelligent Career Petty Officer who has such command of the basic professional techniques that he can direct his actions to job perfection and the well-being of his subordinates.

DRIVE 3  
INTELLECTUAL FUNCTIONING 3  
PROFESSIONALISM 4  
TECHNICAL SKILLS 4  
PRODUCTIVITY AND ACHIEVEMENT 5  
LEADERSHIP AND DIRECTING 4

He is tidy, intelligent, and obtains the best results from his men.

GROOMING AND ATTIRE 3  
INTELLECTUAL FUNCTIONING 3  
LEADERSHIP AND DIRECTING 5

Additional Indexing Clues:

Learned quickly

INTELLECTUAL FUNCTIONING 4

Coherent mental organization

INTELLECTUAL FUNCTIONING 3

Coherence of his thoughts

INTELLECTUAL FUNCTIONING 3

Intelligence

INTELLECTUAL FUNCTIONING 3

Keen minded

INTELLECTUAL FUNCTIONING 3

Common sense

INTELLECTUAL FUNCTIONING 3

Judgment

INTELLECTUAL FUNCTIONING 3

Insight

INTELLECTUAL FUNCTIONING 3

Alert would be indexed as INTELLECTUAL FUNCTIONING 3. However, if the ratee is alert to a command or an order, it would be indexed as RESPONSIVENESS 3.

Analytical mind would be indexed as INTELLECTUAL FUNCTIONING 3. Sometimes intellectual functioning, planning, and controlling become confused. It is important here to keep in mind whether the rater was referring to the function of planning or controlling or whether he was making a statement about the ratee's intellectual functioning, i.e., his general analytical ability, his ability to proceed logically, or his problem-solving ability. For example, "His imagination allows him to find new and different solutions to problems which others do not seem to be able to solve," would be indexed as RESOURCEFULNESS 3 and INTELLECTUAL FUNCTIONING 4.

LEADERSHIP AND DIRECTING represent motivating, guiding, and supervising of subordinates to accomplish a job and work towards improved performance. Includes encouraging subordinates in cooperative endeavors and also in self-development through counseling. A measure would be morale.

LEADERSHIP AND DIRECTING also would be creating an atmosphere that makes teamwork possible, such as improving working conditions.

EXAMPLES:

His excellent leadership qualities were especially manifest when he was assigned to lead the maintenance efforts on CQ. detachments in CONSTELLATION and INDEPENDENCE.	LEADERSHIP AND DIRECTING 5
Ratee handles his men in an effective manner and always gets good results from his subordinates.	LEADERSHIP AND DIRECTING 4 LEADERSHIP AND DIRECTING 4
Ratee's knowledge of the S-2E Electronic System is outstanding, and he is able to utilize this exceptional knowledge through skillful management of shop personnel and an innate ability to pass along what he knows to others.	TECHNICAL SKILLS 5 TECHNICAL SKILLS 5 LEADERSHIP AND DIRECTING 4 COMMUNICATION 4
He spent a great deal of extra time with his men and turned out well trained, well motivated men for the fleet.	LEADERSHIP AND DIRECTING 4 STAFFING 4 LEADERSHIP AND DIRECTING 4
Ratee has the ability to solve problems and motivate people.	INTELLECTUAL FUNCTIONING 3 LEADERSHIP AND DIRECTING 3
His loyalty was shown in the conscientious manner in which he attended to the problems of his men.	CONDUCT, INTEGRITY, AND PRIDE 3 LEADERSHIP AND DIRECTING 3
He appears to be indifferent to the personnel administration of his men especially in regard to special requests and advancement.	LEADERSHIP AND DIRECTING 2
Although the tasks assigned to the personnel under his supervision are always completed efficiently and in an excellent to outstanding manner, his superiors feel that he is capable of getting more out of his men and of putting more of himself into the job.	PRODUCTIVITY AND ACHIEVEMENT 5 LEADERSHIP AND DIRECTING 2 DRIVE 2

## LEADERSHIP AND DIRECTING (Continued)

Additional Indexing Clues:

Gets most out of them	LEADERSHIP AND DIRECTING 5
Best results from men	LEADERSHIP AND DIRECTING 5
Consistent in direction of personnel	LEADERSHIP AND DIRECTING 4
High shop esprit	LEADERSHIP AND DIRECTING 4
High regard for men	LEADERSHIP AND DIRECTING 4
Aggressive leadership	LEADERSHIP AND DIRECTING 4
Molded crew into competent and effective team	LEADERSHIP AND DIRECTING 4
Directs men well	LEADERSHIP AND DIRECTING 4
High expectations from men	LEADERSHIP AND DIRECTING 4
High regard for team concept	LEADERSHIP AND DIRECTING 4
Promotes harmony and accord	LEADERSHIP AND DIRECTING 4
Men cheerful	LEADERSHIP AND DIRECTING 3
Led the shop	LEADERSHIP AND DIRECTING 3
Encourages and guides subordinates	LEADERSHIP AND DIRECTING 3
Helped men advance in rate	LEADERSHIP AND DIRECTING 3
Leads by setting the example	LEADERSHIP AND DIRECTING 3
Leadership ability	LEADERSHIP AND DIRECTING 3
Men trust him/loyal to him	LEADERSHIP AND DIRECTING 3
Finds time to direct and counsel young men	LEADERSHIP AND DIRECTING 3
Skilled at managing his men	LEADERSHIP AND DIRECTING 3
Tact in handling subordinates	LEADERSHIP AND DIRECTING 3
His men are hard working	LEADERSHIP AND DIRECTING 3
No disciplinary problems	LEADERSHIP AND DIRECTING 3
Mindful of his position as a leader	LEADERSHIP AND DIRECTING 3
Lack of leadership	LEADERSHIP AND DIRECTING 2
Needs more forceful approach to leadership	LEADERSHIP AND DIRECTING 2

Many experts in the field of management feel that the connection between performance and possession of traits is doubtful. But practically every study has found successful managers to be strong leaders. Leadership is not only an ability or trait but it is also a very important function of

## LEADERSHIP AND DIRECTING (Continued)

management. To direct his subordinates, a manager must motivate, communicate, and lead. Directing is a function that includes all those activities which are designed to encourage subordinates to work effectively and efficiently. A manager must be concerned for human feelings and morale. For example, "He is tactful with his subordinates." It can be seen here that interpersonal relations between a ratee and his subordinates is important to the leadership and directing function. The rapport that a ratee has with his divisional personnel would be indexed with LEADERSHIP AND DIRECTING. However, a ratee's interpersonal relationship with his peers or superiors probably would be indexed by one of the following terms: CONDUCT, INTEGRITY, AND PRIDE; COOPERATION; REPRESENTATION; or RESPONSIVENESS. There is one exception to this rule. When the statement has to do with a ratee's cooperative attitude in working with others, superiors or subordinates, use the index term COOPERATION. The rapport that a ratee has with other organizational units enhances his division's work and, therefore, the index term REPRESENTATION would be used.

A manager must act his part and be conscious of the impact of his behavior on his men. For example, "He leads by example."

A manager also must look after the individual needs of his subordinates and provide a challenge for them. He must be responsive to their needs and to their ideas and suggestions.

The words *supervising* or *directing* can apply to tasks, men, or both. The indexer has to judge what the rater means. It usually can be assumed that supervising refers to the overall managerial functions or tasks (MANAGEMENT FUNCTIONS), unless stated or inferred otherwise.

MANAGEMENT FUNCTIONS are those job duties which are characteristic of all managers. Though operations may differ from one organization to another, the functions of the manager are common to all.

EXAMPLES:

He is an excellent manager and organizer who is willing to accept any assignment no matter how difficult.

MANAGEMENT FUNCTIONS 5  
ORGANIZATION 5  
RELIABILITY AND DEPENDABILITY 5

Chief XX has made a prime contribution to the ship through his excellent supervision of the Fuel Oil and Water Testing Laboratory and the Oil Kings.

PRODUCTIVITY AND ACHIEVEMENT 4  
MANAGEMENT FUNCTIONS 5

Ratee's superior leadership capabilities and overall knowledge of management greatly contributed to this division receiving a grade of 4.0 during the annual administrative inspection.

LEADERSHIP AND DIRECTING 5  
MANAGEMENT FUNCTIONS 4  
PRODUCTIVITY AND ACHIEVEMENT 4

He is well versed in the 3-M System and always exhibits sound management practices.

TECHNICAL SKILLS 4  
MANAGEMENT FUNCTIONS 4

His administrative knowledge and ability to supervise and coordinate the efforts of other instructors enabled this command to develop all the material required for realistic support of the E2B Aircraft.

MANAGEMENT FUNCTIONS 3  
LEADERSHIP AND DIRECTING 3  
ORGANIZATION 3  
PRODUCTIVITY AND ACHIEVEMENT 4

BTC has an excellent working and practical knowledge of the PMS System but has a tendency to be lax in the administrative phase of the system.

TECHNICAL SKILLS 5  
MANAGEMENT FUNCTIONS 2

Additional Indexing Clues:

Proficient Petty Officer

MANAGEMENT FUNCTIONS 4

The words *supervising* or *directing* can apply to tasks or men. The indexer has to judge what the rater means. It usually can be assumed that supervising refers to the overall managerial functions or tasks, unless stated or inferred otherwise. If the statement refers to the supervising or directing of men only, then use LEADERSHIP AND DIRECTING.

## MANAGEMENT FUNCTIONS (Continued)

E-7/8/9 Evaluation Reports describe the on-job performance of junior level managers. Managers at a junior level have technical as well as managerial functions. This should be remembered when indexing a statement that includes the ratee's job title. For example, if the statement claims that the ratee is an "excellent Radioman or Boilerman," we would assume that the rater was referring to his technical skills and label it as such. But on the other hand, if a statement claims that the ratee is an "excellent Chief Petty Officer or Supervisor," it would be assumed that the rater is referring more to the ratee's managerial functions and would be labeled accordingly. Also remember that if *Instructor* is a ratee's job title, a statement regarding his instructing would be labeled as MANAGEMENT FUNCTIONS, whereas if the reference is to how a ratee instructs during the course of his other duties, use the label COMMUNICATION.

In evaluating a ratee, the indexer should be interested in how the ratee performs his managerial functions. These functions are the means by which the manager proceeds to accomplish his job. When a statement refers to how he performs these overall tasks, use MANAGEMENT FUNCTIONS. However, when a statement refers to the results accomplished from performing these tasks, use PRODUCTIVITY AND ACHIEVEMENT.

ORGANIZATION is the establishment of an intentional structure of roles through the determination and enumeration of activities required to achieve enterprise goals such as grouping activities and roles, delegating authority, and coordinating authority relationships.

EXAMPLES:

He does an excellent job of planning, organizing, and carrying out his job.

PLANNING 5  
ORGANIZATION 5  
PRODUCTIVITY AND ACHIEVEMENT 5

He has developed an extremely tightly knit division which has an uncommon amount of pride in its work.

ORGANIZATION 5  
LEADERSHIP AND DIRECTING 5

He is a highly motivated and aggressive individual with a good sense of organization and administrative ability.

DRIVE 4  
DRIVE 4  
ORGANIZATION 4  
MANAGEMENT FUNCTIONS 4

Ratee spends a very limited time in the shop but has exerted a spirit of independence in his First Class, the result being a well organized and efficient shop.

DRIVE 2  
LEADERSHIP AND DIRECTING 4  
ORGANIZATION 4  
PRODUCTIVITY AND ACHIEVEMENT 4

His ability to assign workload in a smooth fashion is noteworthy.

ORGANIZATION 4

He is a professional administrator and understands the principles of delegation.

PROFESSIONALISM 3  
MANAGEMENT FUNCTIONS 4  
ORGANIZATION 3

The ratee's ability to work with others, his capacity for organization and stimulating enthusiasm makes him a valuable asset to any unit.

COOPERATION 3  
ORGANIZATION 3  
DRIVE 4  
ASSET TO THE NAVY 4

He reorganized the work center.

ORGANIZATION 3

His initiative at times lags, and he tends to undertake too many tasks alone rather than delegating them to subordinates.

INITIATIVE 2  
ORGANIZATION 2

Additional Indexing Clues:

Excellent organizer

ORGANIZATION 5

Excellent job setting up the operation

ORGANIZATION 5

## ORGANIZATION (Continued)

Set up a file on each item	ORGANIZATION 3
Ability to coordinate	ORGANIZATION 3
Coordinates work centers	ORGANIZATION 3
Coordination of work duties	ORGANIZATION 3

If a ratee sets up a *liaison* with another organizational unit or division within the Navy or an outside organization, the index term ORGANIZATION would be used. However, if a ratee uses the *liaison* or organizational structure that is already set up to enhance his division's working relationship with other organizational units, the index term REPRESENTATION would be used. If a *liaison* is used as a channel of communication, then the index term USE OF COMMUNICATION would be used.

PLANNING is a decision-making process involving the selection among alternatives of objectives, policies, and programs and the procedures for achieving them.

Types of plans include objectives, policies, methods or procedures, rules, programs, budgets, strategies, schedules, traffic flow patterns, and inventory.

EXAMPLES:

He does an excellent job of planning, organizing, and carrying out his job.

PLANNING 5  
ORGANIZATION 5  
PRODUCTIVITY AND ACHIEVEMENT 5

He is methodical, deliberate, and able to develop effective and efficient procedural methods of accomplishing the division workload.

SKILLS AND ABILITIES 3  
SKILLS AND ABILITIES 3  
PLANNING 4

Ratee's resourcefulness in setting up a procedure to instruct 150 recruits daily in this very difficult operation was largely responsible for the efficient operation of the matches.

RESOURCEFULNESS 3  
PLANNING 4  
PRODUCTIVITY AND ACHIEVEMENT 4

He had the ability and initiative to plan and assign work to personnel under his direction to ensure that the end results are of the highest quality.

INITIATIVE 3  
PLANNING 3  
ORGANIZATION 3  
CONTROLLING 5

His analysis of divisional problems, both functional and administrative, and the execution of corrective measures have been very conducive to a smooth and highly effective division.

PLANNING 3  
CONTROLLING 3  
PRODUCTIVITY AND ACHIEVEMENT 4

Additional Indexing Clues:

Found new ways to improve the security of the Communications building

PLANNING 4

Good decision maker

PLANNING 4

Improves plans

PLANNING 4

Has alternate plans

PLANNING 3

POTENTIAL refers to the capacity and/or recommendation for an individual to assume a higher rank or added responsibilities.

EXAMPLES:

Chief XX has demonstrated the potential to be an outstanding leader.	POTENTIAL 5
He would be most valuable in an instructor billet assignment.	POTENTIAL 5
There is nothing that can arise in his present position or next assignment that ratee cannot cope with.	POTENTIAL 5
He is highly recommended for advancement.	POTENTIAL 4
Chief XX is highly recommended for advancement and retention in the Naval Reserve.	POTENTIAL 4
He is qualified to assume the greater responsibility of the next higher pay grade.	SKILLS AND ABILITIES 3 POTENTIAL 3
Ratee is fully qualified for advancement in rate.	SKILLS AND ABILITIES 4 POTENTIAL 3
Ratee is very knowledgeable in the supply system and is recommended for E-8.	TECHNICAL SKILLS 4 POTENTIAL 3
With more time and conscientious effort, he should realize a greater potential.	POTENTIAL 2

Additional Indexing Clues:

Outstanding potential for added responsibility	POTENTIAL 5
Highly recommended for advancement	POTENTIAL 4
Strongly recommended for promotion	POTENTIAL 4
Eminently well qualified for advancement	SKILLS AND ABILITIES 4 POTENTIAL 3
Expected to improve	POTENTIAL 3
Capable of assuming more responsibility	POTENTIAL 3

PRODUCTIVITY AND ACHIEVEMENT refers to the successful accomplishment of a desired result in terms of an individual's performance of his job duties (managerial functions). Use this descriptor term unless a specific function is mentioned in the narrative content of the Evaluation Report.

EXAMPLES:

Every assignment is performed with unusual accuracy and effectiveness.	PRODUCTIVITY AND ACHIEVEMENT 5
Ratee's performance is outstanding in all aspects.	PRODUCTIVITY AND ACHIEVEMENT 5
Performance in both his primary and secondary billets has been outstanding in all aspects as marked in block 19.	PRODUCTIVITY AND ACHIEVEMENT 5
Under his supervision the shop has met and surpassed the accepted norms of productivity.	PRODUCTIVITY AND ACHIEVEMENT 4
Production over the past six months has been about average for a two-man station.	PRODUCTIVITY AND ACHIEVEMENT 3
His technical competence and resourcefulness contributes to ships in tending to maintain operational readiness.	TECHNICAL SKILLS 3 RESOURCEFULNESS 3 PRODUCTIVITY AND ACHIEVEMENT 3
His performance has been commensurate with his rate.	PRODUCTIVITY AND ACHIEVEMENT 3
While he was acting as ship's Oil King, the ship witnessed three oil spills while refueling.	PRODUCTIVITY AND ACHIEVEMENT 2
His extremely poor performance of his duties led directly to the ship's boilers not being in a state of operational readiness.	PRODUCTIVITY AND ACHIEVEMENT 1

Additional Indexing Clues:

Never allowed shop to wane	PRODUCTIVITY AND ACHIEVEMENT 5
Outstanding performance	PRODUCTIVITY AND ACHIEVEMENT 5
Handled duties in an outstanding manner	PRODUCTIVITY AND ACHIEVEMENT 5
Impressive discharge of duty	PRODUCTIVITY AND ACHIEVEMENT 4

## PRODUCTIVITY AND ACHIEVEMENT (Continued)

Performed remarkably well	PRODUCTIVITY AND ACHIEVEMENT 4
Success in a difficult task	PRODUCTIVITY AND ACHIEVEMENT 3
Assignments are completed or completes assigned tasks	PRODUCTIVITY AND ACHIEVEMENT 3
Has seen these tasks through to their successful completion	PRODUCTIVITY AND ACHIEVEMENT 3
Effort brings a success	PRODUCTIVITY AND ACHIEVEMENT 3

Statements of improvement should be indexed as PRODUCTIVITY AND ACHIEVEMENT. For example:

Made significant improvements	PRODUCTIVITY AND ACHIEVEMENT 4
Made improvements	PRODUCTIVITY AND ACHIEVEMENT 3
Enabled him to improve	PRODUCTIVITY AND ACHIEVEMENT 3
Yielded benefits	PRODUCTIVITY AND ACHIEVEMENT 3
Room for improvement	PRODUCTIVITY AND ACHIEVEMENT 2

It is important to make certain that the achievement was not a personal technical accomplishment in which case TECHNICAL SKILLS would be used.

If a statement refers to the successful accomplishment of a maintenance effort and it is not the controlling function of ensuring the accomplishment of a plan, but rather the performance of a ratee's total job function, use PRODUCTIVITY AND ACHIEVEMENT. This can be determined by looking at the ratee's job title or main job duty as stated in Section 4A.

The following modifiers can serve as clues to labeling a statement or a phrase as PRODUCTIVITY AND ACHIEVEMENT: contributed greatly to (4), contributed immensely to (4), significant increase in (4), contributed materially to (4), directly responsible for (3), directly contributed to (3), has been instrumental in (3), directly instrumental in (3).

If a statement of personal achievement (e.g., advancement in rate) is made in a matter-of-fact manner, do not index it. However, if it is stated as an accomplishment, use PRODUCTIVITY AND ACHIEVEMENT. For example, "Ratee's performance in the past was responsible for his selection from every first class and chief petty officer in this command as Command Career Counselor." PRODUCTIVITY AND ACHIEVEMENT 5.

An ability in performing a task would be indexed as PRODUCTIVITY AND ACHIEVEMENT because it tells how the ratee is performing and, therefore, is a type of measure of his performance. However, an ability or skill to perform in a certain way suggests a future performance and would be indexed as SKILLS AND ABILITIES. For example, "His thoroughness in performing his duty is outstanding," PRODUCTIVITY AND ACHIEVEMENT 5; "Outstanding in his work," PRODUCTIVITY AND ACHIEVEMENT 5; "Chief XX is a performer," PRODUCTIVITY AND ACHIEVEMENT 3; "He performs in a capable manner," PRODUCTIVITY AND ACHIEVEMENT 3; "He has the ability to perform in an outstanding manner," SKILLS AND ABILITIES 5.

PROFESSIONALISM is the quality of being worthy of the high standards of the managerial profession and having much experience and great skill in this role. Use only when the word *professional* or *professionalism* is applied to the ratee and/or his performance and only when it is mentioned specifically in the narrative content of the Evaluation Report.

EXAMPLES:

Ratee has consistently demonstrated his outstanding professional qualifications.

PROFESSIONALISM 5

These accomplishments were achieved through high professionalism, enthusiasm, and superior decision-making ability.

PROFESSIONALISM 4  
DRIVE 4  
PLANNING 5

As an Airborne Communications Supervisor, ratee's professional competence has contributed to flight operations, excellent mission performance, and praise for his division.

PROFESSIONALISM 3  
PRODUCTIVITY AND ACHIEVEMENT 5

His performance reflects competence and professionalism.

PRODUCTIVITY AND ACHIEVEMENT 3  
SKILLS AND ABILITIES 3  
PROFESSIONALISM 3

Chief XX was relieved of his duties as the ship's Oil King after serving in the capacity for approximately two months. He was removed from this billet because of his lack of professional knowledge and technical know-how in the art of refueling.

AWARDS AND PUNISHMENT 1  
PROFESSIONALISM 2  
TECHNICAL SKILLS 2

Additional Indexing Clues:

Professional attitude

PROFESSIONALISM 3  
CONDUCT, INTEGRITY, AND PRIDE 4

Professional behavior

PROFESSIONALISM 3  
CONDUCT, INTEGRITY, AND PRIDE 4

Professional administrator

PROFESSIONALISM 3  
MANAGEMENT FUNCTIONS 4

Professional skill

PROFESSIONALISM 3

When the word *professional* modifies a *specific* skill, ability or function, it automatically gives a weight of 4 to that skill, ability or function.

When the word *professional* modifies skill or ability, use only the index term PROFESSIONALISM since this term is more specific than SKILLS AND ABILITIES and falls under SKILLS AND ABILITIES in the hierarchy of index terms.

RELIABILITY AND DEPENDABILITY is the combined quality of being counted upon to do what is expected or required without direct supervision or monitoring. Connotes levelheadedness or steadiness; includes *trustworthy, responsible, constancy, stability, and mature.*

EXAMPLES:

He is completely reliable and has never showed case by action or word to the contrary.	RELIABILITY AND DEPENDABILITY 5
He is conscientious and is always extremely dependable.	DRIVE 3 RELIABILITY AND DEPENDABILITY 5
Fully realizes his responsibilities and at all times consciously acts to fulfill them.	RELIABILITY AND DEPENDABILITY 4 RELIABILITY AND DEPENDABILITY 4
Ratee is very reliable.	RELIABILITY AND DEPENDABILITY 4
Ratee is punctual and can be depended upon to perform well regardless of the amount of supervision.	CONDUCT, INTEGRITY, AND PRIDE 3 RELIABILITY AND DEPENDABILITY 4
He can be depended upon to "get the job done" with a minimum of supervision.	RELIABILITY AND DEPENDABILITY 3
Ratee's inability to satisfactorily discharge his financial obligations shows a lack of responsibility.	CONDUCT, INTEGRITY, AND PRIDE 2 RELIABILITY AND DEPENDABILITY 2

Additional Indexing Clues:

Always ready to accept additional responsibility	RELIABILITY AND DEPENDABILITY 5
Willing to assume or accept added responsibility	RELIABILITY AND DEPENDABILITY 4
Works well on his own	RELIABILITY AND DEPENDABILITY 4
Completely reliable	RELIABILITY AND DEPENDABILITY 4
Job done without supervision	RELIABILITY AND DEPENDABILITY 3
Can work without direction	RELIABILITY AND DEPENDABILITY 3
Requires no supervision	RELIABILITY AND DEPENDABILITY 3
Dependable	RELIABILITY AND DEPENDABILITY 3

## RELIABILITY AND DEPENDABILITY (Continued)

Stable	RELIABILITY AND DEPENDABILITY 3
Trustworthy	RELIABILITY AND DEPENDABILITY 3
Responsible	RELIABILITY AND DEPENDABILITY 3
Constancy	RELIABILITY AND DEPENDABILITY 3
Does not need to be supervised	RELIABILITY AND DEPENDABILITY 3
Performs without supervision	RELIABILITY AND DEPENDABILITY 3
Accepted responsibilities and authority	RELIABILITY AND DEPENDABILITY 3
Assumes added responsibilities	RELIABILITY AND DEPENDABILITY 3
Mature	RELIABILITY AND DEPENDABILITY 3
Reluctance to assume new tasks	RELIABILITY AND DEPENDABILITY 2
Need for direction and checkup by superiors	RELIABILITY AND DEPENDABILITY 2
Relinquishes responsibility	RELIABILITY AND DEPENDABILITY 2

It is important to remember when indexing that the concept of responsibility belongs under RELIABILITY AND DEPENDABILITY.

REPRESENTATION is the creating of an image of an organization to the external or internal environment.

EXAMPLES:

He is an outstanding representative of the Navy in all respects. REPRESENTATION 5

Ratee has been very successful in improving his Branch Station's relations with local high schools and youth organizations. REPRESENTATION 4

He takes an active part in church and civic programs, helping to uphold the Navy image in the community. REPRESENTATION 4

The appearance of this building is a fine example and reflection of the Navy to the visiting civilians. REPRESENTATION 4

Additional Indexing Clues:

Active in extracurricular activities REPRESENTATION 4

Takes part in extracurricular activities REPRESENTATION 3

Public relations for his branch REPRESENTATION 3

Status of his branch or job area REPRESENTATION 3

Remember that if a ratee's job title or main job duty is public relations, then the term PRODUCTIVITY AND ACHIEVEMENT would be used rather than REPRESENTATION since the statement would be referring to the performance of his total job function.

Some management experts do not consider REPRESENTATION to be a separate managerial function. However, in this dictionary it is considered to be a separate function because of the importance given to relating to the civilian community by Naval personnel.

If a ratee sets up a *liaison* with another organizational unit or division within the Navy or an outside organization, the index term ORGANIZATION would be used. However, if a ratee uses the *liaison* or organizational structure that is already set up to enhance his division's working relationship with other organizational units, the index term REPRESENTATION would be used. If a *liaison* is used as a channel of communication, then the index term USE OF COMMUNICATION would be used. The rapport that a ratee has with other organizational units also enhances his division's work, and the index term REPRESENTATION would be used. The rapport that a ratee has with his divisional personnel would be indexed with LEADERSHIP AND DIRECTING.

REPUTE is the position or standing of an individual in his relationships to subordinates, peers, and superiors.

EXAMPLES:

He possesses the character, personality, and desire that commands the highest respect and admiration from his associates.

CONDUCT, INTEGRITY, AND PRIDE 3  
CONDUCT, INTEGRITY, AND PRIDE 3  
DRIVE 3  
REPUTE 5

This action has generated the highest degree of trust and confidence with his superiors.

REPUTE 5

He readily obtains the confidence of all who come in contact with him.

REPUTE 4

He is well liked and highly respected by juniors and seniors alike, and his easy-going manner and pleasant congeniality make him at home in any surroundings.

REPUTE 4  
CONDUCT, INTEGRITY, AND PRIDE 3  
COOPERATION 4  
FLEXIBILITY 3

Ratee is highly regarded by all of his men.

REPUTE 4

He expresses himself clearly and logically and his views are respected by those with whom he works.

COMMUNICATION 3  
REPUTE 3

Additional Indexing Clues:

He has their full respect and gets it.

REPUTE 4

He is highly regarded by his men.

REPUTE 4

Gains the genuine respect

REPUTE 4

Praised

REPUTE 4

Inspires respect

REPUTE 3

Justified others' confidence in him

REPUTE 3

Commands respect and gets it

REPUTE 3

Expertise widely acknowledged and respected by others

TECHNICAL SKILLS 4  
REPUTE 3

His advice is sought by others because of his technical skill.

REPUTE 3  
TECHNICAL SKILLS 3

## REPUTE (Continued)

Merits the respect	REPUTE 3
Generates respect	REPUTE 3
Respected by	REPUTE 3
Popular	REPUTE 3

Many of the feelings that a ratee's peers and superiors have for him would be indexed as REPUTE (e.g., being liked or trusted by his superiors). However, if it is the ratee's subordinates who have these same feelings, it would indicate the ratee's leadership abilities and be labeled as such (e.g., being liked or trusted by his men). If the words *respect* or *regard* are used, then automatically label this statement with REPUTE. For example, "His concern for his men has won the respect of his subordinates." LEADERSHIP AND DIRECTING 3; REPUTE 3.

The concept of a ratee's *repute* may appear in the narrative text under the guise of one or more descriptive phrases, but this segment of text should be treated as containing a single concept and be labeled only once with REPUTE. For example, "He is well liked and highly respected," would be treated as one phrase or concept and would be indexed only once with the index term REPUTE.

RESOURCEFULNESS is the innovative or creative ability to make effective and efficient use of men and materials resulting in improved performance.

EXAMPLES:

He has consistently demonstrated exceptional resourcefulness in dealing with especially complicated projects.	RESOURCEFULNESS 5
He makes the best use of all the resources at his command.	RESOURCEFULNESS 5
A direct indication of the Ratee's resourcefulness is indicated in the fact that he insists on obtaining maximum utilization of the Navy's training material.	RESOURCEFULNESS 3 RESOURCEFULNESS 5
Since the turnover of these modules is high, this represents a significant savings to the Navy's resources.	RESOURCEFULNESS 4
He has demonstrated a remarkable ability for substituting components or test equipment that might be temporarily unavailable.	RESOURCEFULNESS 4
In his area of responsibility he requires that consumable modules be repaired and reused.	RESOURCEFULNESS 3
Chief XX is a resourceful man and his potential is great to become an even better Chief.	RESOURCEFULNESS 3 POTENTIAL 4
His imagination allows him to find new and different solutions to problems which others do not seem to be able to solve.	RESOURCEFULNESS 3 INTELLECTUAL FUNCTIONING 4

Additional Indexing Clues:

Always resourceful	RESOURCEFULNESS 4
Fully utilizes his men	RESOURCEFULNESS 4
Inventiveness	RESOURCEFULNESS 3
Imagination	RESOURCEFULNESS 3
Ingenuity	RESOURCEFULNESS 3

RESPONSIVENESS is the quality of reacting promptly, readily, accurately, and alertly to suggestion, instruction, or orders.

EXAMPLES:

Ratee is extremely cooperative in all his undertakings when given any task, and completes it in the most expeditious manner.

COOPERATION 5  
RESPONSIVENESS 5

He is quick to respond to any situation or problem and to find a solution.

RESPONSIVENESS 4  
INTELLECTUAL FUNCTIONING 3

He uncomplainingly responds when called upon to meet unscheduled commitments, frequently under adverse conditions.

RESPONSIVENESS 4  
ENDURANCE 3

He is responsive and agreeable to demands upon him and constantly seeks ways of improving working conditions and morale.

RESPONSIVENESS 3  
COOPERATION 3  
LEADERSHIP AND DIRECTING 4

Additional Indexing Clues:

Alertness is usually considered to be a part of intellectual functioning. However, if a statement refers to a ratee's alertness to an order, then consider it to be a responsive gesture on the part of the ratee.

When in doubt about whether a statement constitutes a cooperative or responsible attitude as opposed to responsiveness on the part of the ratee, use either COOPERATION or RELIABILITY AND DEPENDABILITY rather than RESPONSIVENESS.

Always use the index term RESPONSIVENESS whenever the word *responds* is used in a statement.

The time element is an important clue to the use of this term and, therefore, would be used to label the following examples:

In a minimum of time

RESPONSIVENESS 5

He carries out all assignments expeditiously and efficiently.

RESPONSIVENESS 4  
PRODUCTIVITY AND ACHIEVEMENT 4

He meets his responsibilities and quotas in a timely manner.

RESPONSIVENESS 3

Ratee presented material to the students in an expeditious manner.

RESPONSIVENESS 3

SERVICE MOTIVATION refers to a serviceman's contentment with life in the Navy, or to his desire or lack of desire to fulfill his commitment to his job duties in the Navy.

EXAMPLES:

He is extremely dedicated to his division, department, and ship. SERVICE MOTIVATION 5

He is an active Navy promoter and is the first to step forward to educate subordinates on Navy policy, procedures, or benefits. SERVICE MOTIVATION 4  
SERVICE MOTIVATION 4

Ratee always wears his uniform with pride, both on and off the ship. SERVICE MOTIVATION 4

He exhibits pride in being part of this command and is a definite asset to the Naval service. SERVICE MOTIVATION 3  
ASSET TO THE NAVY 4

He is a dedicated career man who displays pride in the Navy and the Squadron. SERVICE MOTIVATION 3  
SERVICE MOTIVATION 3

Additional Indexing Clues:

The ratee always has the best interests of the Navy in mind. SERVICE MOTIVATION 5

Pride in the Navy SERVICE MOTIVATION 3

Pride in his unit SERVICE MOTIVATION 3

Dedication or devotion to duty SERVICE MOTIVATION 3

Loyal to duty and men SERVICE MOTIVATION 3

Enjoying his work SERVICE MOTIVATION 3

SKILLS AND ABILITIES are those qualities that influence the producing of a desired result in an efficient and effective manner.

EXAMPLES:

He is able to direct the efforts of Line Personnel in an efficient and effective manner; this is reflected in the Ratee by a multiple of exceptional qualities.	LEADERSHIP AND DIRECTING 4 SKILLS AND ABILITIES 5
This man is extremely competent.	SKILLS AND ABILITIES 5
Above average in all areas, he is fully qualified to assume the greater responsibility of the next higher rank.	SKILLS AND ABILITIES 4 SKILLS AND ABILITIES 4 POTENTIAL 3
He daily demonstrates all of the highly desirable traits of a Chief Petty Officer.	SKILLS AND ABILITIES 4
Ratee is very meticulous and thorough.	SKILLS AND ABILITIES 4 SKILLS AND ABILITIES 4
His natural abilities and responsible approach to recruiting have enabled the ratee to outperform his contemporaries.	SKILLS AND ABILITIES 3 RELIABILITY AND DEPENDABILITY 3 PRODUCTIVITY AND ACHIEVEMENT 4

Additional Indexing Clues:

Exceptionally well qualified	SKILLS AND ABILITIES 5
Outstanding individual	SKILLS AND ABILITIES 5
Well-qualified Supervisor	SKILLS AND ABILITIES 4
Efficient	SKILLS AND ABILITIES 4

Any mention of managerial or administrative abilities would be labeled MANAGEMENT FUNCTIONS.

SKILLS AND ABILITIES is used as a catchall term for those skills and abilities which do not fit any of the more specific index terms that come under SKILLS AND ABILITIES in the hierarchy. The following terms would be labeled under SKILLS AND ABILITIES since there is no other more specific index term that would describe them: qualities, skills, traits, attention to detail, meticulous, thorough, methodical, competent, capable, decisiveness, deliberate in thinking (deliberate in action would be indexed as CONDUCT, INTEGRITY, AND PRIDE), and talented.

STAFFING is the manning of and keeping manned the positions provided for by the organization structure. Includes *training* and the *appraisal* or *assessment of personnel*.

EXAMPLES:

His instructions are presented in such a manner that maximum training is accomplished in the time allotted.

COMMUNICATION 3  
STAFFING 5

He spent a great deal of extra time with his men and turned out well trained, well motivated men for the fleet.

LEADERSHIP AND DIRECTING 4  
STAFFING 4  
LEADERSHIP AND DIRECTING 4

He is continually researching the available training and ensuring that assigned personnel have what is needed.

STAFFING 4  
CONTROLLING 4

Ratee has tutored division personnel in all aspects of the Navy publications system.

STAFFING 3

Additional Indexing Clues:

Men re-enlist

STAFFING 3

The manning of and keeping manned the job positions would involve selection, training, and the compensation of personnel in order to keep them in the Navy. It is important to remember that if the main job duty is recruiting, then usually a statement about manning of and keeping manned positions in the Navy would be the result of a ratee's total management function, and hence would be indexed as PRODUCTIVITY AND ACHIEVEMENT.

TECHNICAL SKILLS refer to the understanding and demonstration of techniques which one applies to a task.

EXAMPLES:

The ratee has an outstanding knowledge of all Electrical Drone Systems in the squadron aircraft.

TECHNICAL SKILLS 5

BTC has an excellent working and practical knowledge of the PMS system but has a tendency to be lax in the administrative phase of the system.

TECHNICAL SKILLS 5  
MANAGEMENT FUNCTIONS 2

He is well versed in the 3-M System and always exhibits sound management practices.

TECHNICAL SKILLS 4  
MANAGEMENT FUNCTIONS 4

Ratee single-handedly tore down and rebuilt an engine in 16 hours so the ship would be ready for the cruise.

TECHNICAL SKILLS 4

He is a very knowledgeable technician who attempts to keep constantly abreast of current changes by devoting his off duty time to the study of technical and nontechnical material through evening college courses.

TECHNICAL SKILLS 4  
DRIVE 5

His technical competence and resourcefulness contribute to ships in tending to maintain operational readiness.

TECHNICAL SKILLS 3  
RESOURCEFULNESS 3  
PRODUCTIVITY AND ACHIEVEMENT 3

Chief XX was relieved of his duties as the ship's Oil King after serving in the capacity for approximately two months. He was removed from this billet because of his lack of professional knowledge and technical know-how in the art of refueling.

AWARDS AND PUNISHMENT 1  
PROFESSIONALISM 2  
TECHNICAL SKILLS 2

Additional Indexing Clues:

Expertise widely acknowledged

TECHNICAL SKILLS 4  
REPUTE 4

Professional knowledge

PROFESSIONALISM 3  
TECHNICAL SKILLS 4

## TECHNICAL SKILLS (Continued)

The following would be indexed as TECHNICAL SKILLS 3: background, knowledge of the responsibility of the ratee, technical skills, technical knowledge, understanding of job duties, experience, understanding of work, "know-how."

The technical skills that a ratee possesses may be referred to by the evaluator with one or more descriptive phrases, but this part of the sentence should be treated as a single entity and labeled only once with TECHNICAL SKILLS. For example, "...his lack of professional knowledge and technical know-how in the art of refueling..." PROFESSIONALISM 2; TECHNICAL SKILLS 2.

If the skill or knowledge is in managing or in one of the specific managerial functions, just use MANAGEMENT FUNCTIONS or the specific function as the label. For example, "He is skilled at managing his men," would be indexed as LEADERSHIP AND DIRECTING 3.

In the original version of this dictionary there was a term FUND OF KNOWLEDGE which was replaced by TECHNICAL SKILLS since managers at a junior level have technical as well as managerial functions. This is the reason why such phrases as "understanding of job duties, experience, and understanding of work" are labeled as TECHNICAL SKILLS. It is important to keep this term in mind and to discriminate between managerial functions and productivity or achievement as opposed to the demonstration of a technical skill.

When a ratee is in the process of acquiring new knowledge or a new skill, it would be an indication of his drive and be labeled as such. The indexer should not use TECHNICAL SKILLS unless the ratee has finished the course and, therefore, already has the knowledge or skill.

USE OF COMMUNICATION is the use an individual makes of the opportunities for information exchange within an organization.

SEE ALSO: COMMUNICATION

EXAMPLES:

He is an excellent administrator and a skillful supervisor, and he keeps himself and his superiors fully informed of all facets of his branch's operation.

MANAGEMENT FUNCTIONS 5  
LEADERSHIP AND DIRECTING 4  
USE OF COMMUNICATION 5

He always keeps his superiors informed of any problems and the status of work in progress.

USE OF COMMUNICATION 5

Ratee always consults with his Division Officer concerning his wishes on a matter, unless time is essential.

USE OF COMMUNICATION 4

He keeps his seniors alerted to pending problems.

USE OF COMMUNICATION 3

Additional Indexing Clues:

Keeps superior well informed

USE OF COMMUNICATION 4

Uses communication to arouse interest, convince, and produce desired results

USE OF COMMUNICATION 3

This term is used *not* to indicate how a ratee communicates, but whether or not he uses his ability to communicate for the purpose of information exchange.

If a ratee sets up a *liaison* with another organizational unit or division within the Navy or an outside organization, the index term ORGANIZATION would be used. However, if a ratee uses the *liaison* or organizational structure that is already set up to enhance his division's working relationship with other organizational units, the index term REPRESENTATION would be used. If a *liaison* is used as a channel of communication, then the index term USE OF COMMUNICATION would be used.

## APPENDIX B

OUTPUT FROM PROGRAM BMD01D - SIMPLE DATA DESCRIPTION  
FOR THE CROSS VALIDATION AND GENERALIZATION SAMPLES

The output of this computer program lists the arithmetic mean, the standard deviation, the standard error of the mean, the maximum value, the minimum value, and the range for each of the 67 variables derived from the content analysis. The output is presented in six parts for each of the two samples. First is shown the output for the Upper, Middle, and Lower criterion groups on the evaluation section of the Evaluation Report. This is followed by the output for the Upper, Middle, and Lower criterion groups on the justification section of the Evaluation Report.

APPENDIX C  
CORRELATIONS AMONG THE 67 VARIABLES\*

CROSS VALIDATION SAMPLE - AT's AND BT's COMBINED (N=222)

EVALUATION SECTION (19R)	178
JUSTIFICATION SECTION (19S)	184
EVALUATION SECTION (19R) VS. JUSTIFICATION SECTION (19S)	190

GENERALIZATION SAMPLE - CS's AND RM's COMBINED (N=222)

EVALUATION SECTION (19R)	199
JUSTIFICATION SECTION (19S)	205
EVALUATION SECTION (19R) VS. JUSTIFICATION SECTION (19S)	211

\* Table 8 (pages 20-21) contains a definition for each of the 67 variables. Variables 1 through 30 are the same as Variables 31 through 60 except for the method of weighting that was used. Therefore, these two sets of variables are highly correlated within the evaluation section and the justification section of both samples. These 30 correlation coefficients are shown in italic type in each correlation matrix for the evaluation section and the justification section.

## APPENDIX D

MANN-WHITNEY U TESTS WITH ASSOCIATED  $z$  VALUES\* AND  
 $t$  TESTS OF MEAN DIFFERENCE ON ALL 67 VARIABLES

## CROSS VALIDATION SAMPLE

*EVALUATION SECTION*

LOWER VS. UPPER	222
LOWER VS. MIDDLE	225
MIDDLE VS. UPPER	228

*JUSTIFICATION SECTION*

LOWER VS. UPPER	231
LOWER VS. MIDDLE	234
MIDDLE VS. UPPER	237

## GENERALIZATION SAMPLE

*EVALUATION SECTION*

LOWER VS. UPPER	240
LOWER VS. MIDDLE	243
MIDDLE VS. UPPER	246

*JUSTIFICATION SECTION*

LOWER VS. UPPER	249
LOWER VS. MIDDLE	252
MIDDLE VS. UPPER	255

\* The convention that was followed in the Mann-Whitney U tests was to enter data into the computer program first for the lower criterion group in the comparison. For those  $z$  values that achieved statistical significance, the direction of the difference is that the higher criterion group evidenced a greater frequency or greater weighted frequency of the variable.

MANN-WHITNEY U TESTS WITH ASSOCIATED z VALUES AND t TESTS OF MEAN DIFFERENCE  
ON ALL 67 VARIABLES FOR THE LOWER VS. UPPER CRITERION GROUPS COMPARISON  
OF THE CROSS VALIDATION SAMPLE ON THE EVALUATION SECTION (19R)

No. of Variable	Name of Variable	Value of U	Absolute Value of z	Probability Level		Value of t	Probability Level
